This is a big help! The equations I read did not help me understand the
problem. (Though when I read 'Rayleigh', thoughts of optical flats and
oversized college physics texts popped into my head.)

So, if I have a 4 element collinear, measuring 2 wl, or about 4 meters,
and the frequency of interest is about 2 meters, then I'm effectively
far field when I reach a distance > 16 wl.

Cool. The neat part about the football field is that the nearest reflection is well over 1.4 times the distance between source and measurement antennae. It's flat with no RF hard surfaces around the perimeter. That's not to say there are no other sources of measurement error, just that I think their contribution will be small.

I'll report back if I can get it done before school starts, and they want my RF range back for their sports activities :-)

Hi Mike,

Another metaphor would be Craps shooting. The distribution of
separate outcomes is each 1 in 36, but there are a preponderance of 7s
over time with very much higher probability. To ignore the
preponderance (this blob) to the observation of single rolls would
have left the design of antennas stuck in the age of Marconi.

> That being the case, I questioned if assuming that the angle for best
>reception is also the angle for best transmission, especially with what
>appears to be a change over time.

Reciprocity is another one of those rules revealed by the
preponderance of outcomes - and so often decried as impossible through
single reports of failure.

However, returning to the original link, and the design behind it, it
is called beam forming as practiced through controlled delays. If the
math reveals that a signal is peaked with one particular setting of a
combination of delays, and if that combination reveals an apparent
source coming in from a particular angle; then we can say that yes,
Virginia, there is a take off angle. We can reasonably expect that
calling back through the same combination of delays through to those
various antennas will result in a more optimum link.

That, or through this design, you can adjust to obtain that optimum
(which will more than likely reveal another take off angle). You will
then be able to ponder why they come in best at one angle while you go
out best at another. Yes, a distinct possibility that becomes more
distinct through this control, and the resolution of take off angles.

Now, as to the matter of this "some sort of blob that leaps off the
antenna." Modeling propagation will reveal if you define a circuit
(the point of origination and the intended audience's location), and
you chip in the general antenna radiation lobe characteristic; then at
significant distances a matter of one degree can be resolved. For

sharply lobed antennas (and this 6 bay is quickly approaching that), the roll-off response and a one degree shift can plunge the listener into deafness. Of course, the vagaries of propagation can easily upset the apple cart - but again, this sharply reveals how "some sort of blob" has become distinctly important compared to the gross distribution of possibilities.

A good link coupled tuner is your best choice (a la' the Johnson Matchbox). The reason is simple. It's a naturally balanced tuner. No need to force the transmitter's unbalanced output into a balanced antenna feed line via a balun (balanced to unbalanced) because there is no direct connection between the transmitter & the feedline. The coupling between the transmitter & the feedline occurs by way of two closely spaced inductors (coils), one is the primary or link the other is the secondary.

You can homebrew a link coupled tuner fairly easily although the small, 250 watt Johnson Matchbox (available on ebay for about $100) can handle 1000 watts PEP SSB since the Matchboxes are rated for continuous duty AM fone.[Formula 1000 watts SSB -50% for no carrier = 500 watts - 50% for one sideband = 250 watts]. I have two.

The only drawback for the Johnson Matchbox is they don't extend down to 160 meters (if you want to work 160).

If your interested in homebrewing your own link coupled tuner, google:
K1JJ Tuner
>From the search results you'll be able to figure out how to build one. I built one [not pretty] that works great. I added a cap to tune the link.

Good Luck

I'm not at all an expert on antenna measurement. I know just enough to realize that it's extremely difficult to do with even moderate accuracy, and that some professionals with the very best equipment tend to trust modeling more than measurement. Besides problems with reflections, you also have the problem of assuring a constant real power into antennas of different impedances, feedline radiation, and a host of other confounding factors.

That being said, I'm sure you'll learn a lot in the process, and you might be able to get useful results in spite of the difficulties.

I was really saddened to see, some years ago, a published group of measurements like you're proposing, on a bunch of different antennas. The results, while quite believable, showed some pattern skewing and other artifacts which almost certainly weren't really due to the antennas themselves. What saddened me was that the people running this detailed, meticulous, and time consuming project hadn't thought to include a measurement of any antenna with a well known pattern and gain such as a dipole. Please include some reference antennas which are well known and/or easy to model! Otherwise, the accuracy of all the results is purely guesswork. A dipole might not be the best reference because its broad pattern is more subject to reflections than a Yagi. But a good reference Yagi (such as one of the NBS standard Yagis) or two could be constructed and included.

You'll get strong reflections from the ground between the antennas. It'll be easy to calculate the elevation angle of the signal from the transmitting antenna which will arrive at the receiving antenna after reflecting from the ground. If your antennas are far apart, this angle will be more nearly horizontal, where antenna gain is higher, than if they're close. So there may will be a stronger reflection if the antennas are farther rather than closer (although most moderately sized horizontal Yagis have a broad elevation pattern, not very different from a dipole). This ground reflection could have a profound effect on measured gain, and could cause some large differences with only small differences in, say, antenna height. If the antennas are close and the

angle steep, then the pattern at the elevation angle being reflected might be quite different from the horizontal antenna pattern. This will result in a distortion of the measured pattern relative to the free space pattern. This is something which will show up more clearly in a plot of a reference Yagi with gain closer to the actual antenna under test than something like a dipole with a simpler pattern.

Have fun! I'll be eager to see how well your reference antenna measurements come out.

My 1957 ARRL Handbook shows the OCF fed with 300 ohm
twinlead using an air-core balun which was popular
at that time. The feedline will radiate some but
that may not be a bad thing. (The Carolina "Windom"
feedline is designed to radiate.) Link coupling,
as used in the Johnson Matchboxes, would minimize
the common-mode current at the tuner.

< snip >

I was curious to see the actual distribution for Craps. If you're curious
enough to scroll down , you can see the blob at 7, courtesy of MS Excel.
It's a apt metaphor for takeoff angle. Thanks, Richard.

Hi Steve

It is fairly easy to record exact radiation patterns of "2 meter" antennas
at 137 MHz, using NOAA satellites at the Illuminator. If you have any
interest in the details, you can contact me anytime.
Patrik Tast developed a (free) program for me that produces elevation
plane patterns of the antenna as the NOAA satellite passes over. Since each
satellite passes over 6 or 8 times per day, decent hemispheric patterns can
be made.
I'd guess that the plot of the antenna pattern, when using Patrik's
program is more accurate than any other method when evaluating ground based
"2 meter" antennas. I am open to learning where I'm wrong about the
accuracy.

Many thanks folks!
I tried out Pat Hawker (G3VA's) matching network from "Amateur Radio
Techniques" and it works like a charm. SWR now nearly 1:1 and antenna
much better on receive also.
I find that propogation and QRN here makes it very useful to have both
horizontal and vertical antennas available.
Fortunately I had a bit of left over minductor that turned out to be
just right for the tapped coil and it tunes nicely with about 150pF
of capacitance.
This match is even with the G5RV raised on the mast.

Examples of the radiation pattern data that can be acquired with Patrik Tast's SignalPlotter program can be seen on one of his sites http://213.250.83.83/~patrik/apt/logs/portable/July-22-2007/daily/

I have used this SignalPlotter program to make radiation pattern plots by recording rssi voltage with a simple voltmeter with a RS232 connection and with LabJack data recorder.

My friend K6SJA described an elegant approach to this problem, so no, it's
not a waste of time.

At the two points where you need to open the elements, insert pull-chain
operated switches. Home Depot has them -- I just bought a couple of them
this month for use in lighting fixtures. Each switch can be rigidly mounted
to a flat fiber insulator and the pull-chains extended with twine through
pulleys near one or both of the antenna's end supports. (This way, you're
not pulling straight down in the middle of the elements and maybe breaking
something.) Whether to operate both switches from one end of the antenna is
your choice.

I don't know max power tolerance. I suppose if you cooked one switch, you
could next try two.

Besides the rather smallish Home Depot switches, I have seen beefier
versions that were built into lamp sockets.

Hello Steve,

The result of the 2*B^2/lambda formula is in meters. For your antenna with 4m size, you can be sure to be in the far field at 16m (AKA Fraunhofer region). The minimum distance must be the sum of the far field distance for both AUT and reference antenna.

As Roy also mentioned, real measurements are difficult. To play your own devil's advocate, you could run gain measurements for different (many) distances. From the Gain versus Distance graph you can get an impression of the accuracy. The same you can do for various heights to get an impression of the influence of ground reflection.

A complete other approach is to include the ground reflection in the measurement. That might no be a bad option. The requirement for such a measurement setup is that for both receive and transmit antennas, the ground reflection must fall well within the main beam. Horizontal polarization is preferred. VSWR of both antennas must not be affected by ground reflection.

Best regards,

Wim

> time also.

I did the same thing at one time on 40m. "Compared a 1/4 WL ground
plane vs a horizontal dipole. You see some strange things at times.
The distance of the path has a large bearing over which is best.
In my case, 800 miles seemed to be about the crossover point
where both would be about the same on peaks. But even then,
sometimes you will see peaks on the vertical that are the strongest.
The ionosphere seems to tumble back and forth.
On the longer paths at say 1500 miles, the peaks on the vertical
would
almost always be the strongest. And the farther the distance out,
the
larger the difference would be. IE: the vertical would be 2 S units
better
vs the dipole to CA. This was very repeatable, and almost the same
margin
on any given night. To VK, the difference would be 4 S units.. Again,
that
same margin most any night.
As you can see, I'm a believer in a good vertical for the lower bands.
The only thing that could beat it were either yagi's, or multi element
arrays like the various curtains, etc.. Other than that, I smoked
everyone
else on the band to DX.. I did run a KW though.. :/ I would be 20
over 9
in Tokyo...
The bobtail curtains could put a hurt on me though... :(
But, they had three elements, vs my one..
I almost always used receive as the indication as to which was best
at a given time. I could probably count the number of times
reciprical
operation didn't pan out on a single hand, and have a few fingers
left..
It's pretty rare not to be reciprical receive vs transmit.. IE: almost
never happens, except in a really weird situations.

>
> That being the case, I questioned if assuming that the angle for best
> reception is also the angle for best transmission, especially with what
> appears to be a change over time.

I think it's quite accurate.. I use my switch and compare.. Whichever
receives the best signal gets the nod as far as transmit.
BTW, my vertical was pretty good compared to many you see...
Was full sized, with the base at 36 ft with sloping radials. Not much
loss involved compared to some you see on the ground with a
few meager radials.. It was a lot better than the 1/4 wave I had
ground mounted with 32 radials.
It would always seem just as "hot" as my dipole on receive. It was
just vertical. So it's quite possible for a lesser vertical not to see
the
results I had. As an example, the ground mount with 32 radials
was barely better than the dipole to CA. You didn't see the 2 S unit
difference as on the elevated GP I used later. So in the case of
the ground mount, the distance where it would overtake the
horizontal antenna on peaks would be farther out, vs the GP.

Well, as I mentioned, this is less about an absolute antenna gain than a
figure of merit. Using a dipole as the first, reference transmitting
antenna is part of the plan. I may be crazy, but I'm not entirely stupid
;-) (Well, maybe. Time will tell...)

Ah, yet another thing I have to consider. Since at least two of the tested antennas will be primarily vertical, I was planning to make the test antennas all vertical. So, I can talk myself into believing the ground reflections are part of the real world installations, or I can chuck it all and rely solely upon modeling. One is probably smarter, the other more viscerally stimulating. I leave to the reader to sort out which is which.

Wim,

Thank you. I really don't know where my head is at lately. Of course,
the square term means the result will have units of length, not wavelength.

As I mentioned in my reply to Roy, the tested antennas are designed to
be vertical, which may play havoc with the whole idea.

More to follow, and thanks for reminding me my basic math skills have
ducked into a hole for the moment!

Both of these designs are of the Balanced L or Double L variety. Both require a balun at the input to convert the 50 ohm unbalanced output of the transmitter to the balanced tuner & feedline. You still haven't gotten away from the main cause of inefficiency & power loss which is the balun. [see http://www.somis.org/bbat.f1.jpg]

These double L tuners can be a PITA to build & use also. You need two identical inductances at all times in the circuit. This requires either some mechanical means of driving two identical roller inductors simultaneously (so that the inductance in each leg always matches) or two identical switched inductors with exactly the same tap points.

The link coupled design of the Matchbox takes the balun (and it's potential for power loss) out of the circuit. They are also much simpler designs, easier to homebrew & tune.

I wonder if you have built a balanced L tuner? I made mine using only hand tools and a drill press and had no problems. Also why do you say they are a PITA to use? I adjust mine using only two knobs - the same number of adustments I use on my Matchbox. Yes, I have both tuners.

Also, just how much of that terrible inefficiency and power loss does that balun have? In the link you gave the balun consisted of nothing more than a length of coax. There would be even less loss using a W2DU type balun in that it requires a shorter length of coax.

Additionally, my balance tuner will give a 1:1 match on all the HF bands (and anything in between) - something the Johnson Matchbox will not do.

So are you talking from experience or just hear say?

My approach, in the early 50's, was not elegant but
it worked and it was fast. I had insulators at the
mid-point of each leg of the 80m dipole with a jumper
wire across them for 80m operation. The dipole was
on pulleys. It only took about three minutes to let
the dipole down, either attach or unattach one end
of the jumper wires, and pull the dipole back up.
Making 50 cents an hour working at Carter's Grocery
on Saturday limited my resources. :-)

The best way I have found to tune a balanced antenna
and feedline system, especially at high power, is at:

http://www.w5dxp.com/notuner.htm

The balun always sees a purely resistive differential
impedance between ~35 ohms and ~75 ohms. A 1:1 balun
with a choking action of 1000 ohms will virtually
eliminate conducted common-mode currents. Symmetrical
placement of the feedline to the antenna reduces
inducted common-mode currents. The needle on the MFJ
current meter barely moves on the most sensitive scale.
Under these circumstances, a w2du balun is not lossy.

Danny,

I've never built a balanced L tuner so I admit I'm speculating. The link coupled designs I've built seemed much easier & simpler mechanically & they will give 1:1 if the taps are in the right place. Just takes some intial fiddling to find the right places but once that's done you're good.

I'll agree the double L's seem to be just as easy to tune but the building always deterred me.

Have you ever measured the balance of your double L at various freqs. (current on each leg of the feedline)?

Sorry its been years since its been in use. I was on a gov shortwave freq
and I dont remember. Normally we answered a net that was being controlled
from Atlanta. I had always assumed we couldnt here the station in SC because
of its antenna orientation but after I had a chance to visit the station I
realized there pattern should have been pretty much omni=directional.

I have gone to homebrewing link coupled balanced tuners... Currently have three for 80 meters and 1 for 160 meters and starting 3 more 160 tuners... All massively overbuilt for ham power levels... Motorized tuning with remote controls and coax from the tuner to the shack...

I gave up on commercial tuners... None are actually balanced... All are compromises for maintaining their profit margin as opposed to optimized for power transfer...

No argument there Richard. I'm certain that on average, antenna X with
one TOA will perform better than antenna B with a different TOA.

I certainly expect that to be the case. But that little experiment I
ran a year or so ago made me not want to accept it without any reservation.

If the ionosphere was a static thing, I would expect the matter of
propagation would be pretty straightforward. Of course it isn't, and a
good thing, else some bands would be useless for certain purposes. But
if there is turbulence, I wouldn't be surprised to have the conditions
change over the course of time, perhaps on the time scales of a typical QSO.

>Terry
>W8EJO

Terry,

I have not measured the current balanced on my feed line as the antenna system is not perfectly balance. Although my antenna is as geometrically balance as I can construct it, the environment where it is installed is not symmetrical . (Yard clutter, ground conditions and etc) That is a whole different topic but is explained very well here: http://k6mhe.com/sub/BalancedFeedLine.pdf

I have measured the balance of my antenna system by measuring the impedance for each leg. On twenty meters, for example, I am seeing about a 10% unbalance. http://k6mhe.com/sub/Balance_Z_L1_L2.gif

Additionally, checking feed line balance by measuring current using RF amp meters of each leg of open line will not accurate due the fact that RF amp meters do not give any phase information. Roy corrected me on that some time ago.

Hi all
Does anyone happen to know how to calculate the capacity of two
rings(two cases, one case is placed in one plane, another case is
placed in parallel, I think this is a classical question, can anyone
give me a resource where I can find the results, thanks.

The Z-match is another link-coupled design useful for driving balanced
feedlines. Compared to the Matchbox, its matching range may be
somewhat wider, especially if both low-Z and high-Z output links are
provided. I'm not sure how its losses compare to the Matchbox...
they'll probably vary depending on whether the Z-match uses an
air-core or toroidal-iron-core link.

The thing to do is run both conductors through a single ferrite core (type 43 is fine) -- you can squeeze them together or use a short piece of two close spaced two conductor wire. Wind a secondary of 10 turns, and terminate the secondary with about 50-100 ohms. Measure the secondary voltage with an RF voltmeter (diode, capacitor, and DVM) or scope. This directly measures the common mode current. Then compare that to the reading you get with only one of the conductors going through the core.

My experience with this antenna (fed with 300-ohm TV twinlead, which was all I could afford at age 16) was electrifying. Using a DX-20 transmitter, I was able to draw nice sparks on 20 mtrs. You may want to do some pruning to find a length that will keep RF out of the shack. My own preference would be to center-feed the 130-foot flat-top with ladder-line and use a link-coupled transmatch to work 80 through 10, including WARC, and not worry about coax losses. You'll be the proud owner of a "Zepp!"

32. Homebrew wifi antenna coax adapters

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-02 01:08:21 UTC
From: robert casey <wa2ise@ix.netcom.com>
Message-ID: <98asi.13044$tj6.7353@newsread4.news.pas.earthlink.net>
Source record: 37746

For some strange reason, wifi connectors are not compatible with normal SMA coax connectors. The center pin is a male in an otherwise female connector. And visa versa.

But you probably have accumulated a few wifi "rubber duck" antennas. Inside the plastic "duck" is just some thin teflon coax cable and a dipole antenna with a 1/4 wave shroud around the coax and 1/4 wave exposed center conductor. It's easy to separate the plastic duck off the antenna, just bend it at the joint just above the elbow and it should just pop off. Being teflon, you don't have to worry about melting it with the soldering iron. This coax looks to be 50 ohm impedance. Get a BNC connector and attach it like you would to coax of this thin type. To deal with the extra thin coax, I used a small solderable metal washer to give the shield clamping connector pieces (the funny looking washers) something to grab when you tighten the threaded on the outside bushing you tighten into the connector. As the connectors I had were meant for fatter coax. Don't forget to place the washers and such on the coax before you solder the washer to the coax shield.

As a test, I inserted two such adapters into the feedline for my wifi antenna, and looked at the wifi utility software window that reports signal strength, and saw no desernable extra signal loss (less than a dB). (I scrapped out a bad wifi booster module to get its reverse SMA connectors to get the mate for the antenna side connector)

Once you have built this adapter, you can then use regular good quality coax cable with BNC connectors (or N or other connector good for microwave work) to connect a homebrew wifi antenna to the wifi computer card. There's also a ham band that shares part of the wifi band, so we could conceivably run high gain high power ham to ham using wifi based equipment.

Hi Mike,

I've spent all day aboard the USS Bunker Hill and had a tour of their
phased array RADAR systems. They use roughly 4000 separate elements
with computer controlled delays to steer the beam anywhere they want
(within a quadrant as there are four panels). The 'tronics consume 3
decks of rack equipment.

Just as well when you have only onsey-twosey variables to control. The
OP had 6 which raises the resolution (the Bunker Hill, 16000+).

No argument there. With phase control you could follow the changes to
some degree (if the incoming signal sweeps out over the horizon, no
phase control is going to capture that).

The "strange" reason is that the FCC requires it.

Part 15 devices, such as 802.11 cards, are supposed to be tested for
compliance and certificated by their manufacturer as a system (radio
and antenna together). Replacing the manufacturer-tested antenna with
a different one (higher gain, or perhaps different impedance) changes
the system's behavior, in a way which means that the tests done by the
manufacturer for Part 15 certification are no longer valid.

The FCC's position is that making such un-tested changes automatically
voids the Part 15 certification of the device, and it's no longer
technically legal to transmit using the modified device.

In order to (try to) deter people from making such arbitrary changes,
the FCC requires that makers of Part 15 radio cards with detachable
antennas use only connectors which are either proprietary, or are "not
generally available". Most manufacturers seem to have settled on
RP-SMA or RP-TNC connector for this purpose.

I've only heard of a very small number of cases (fingers-of-one-hand)
in which the FCC has cited someone for running non-certificated WiFi
equipment... and in the only case I can remember clearly, a
non-certificated amplifier was being used to push about 5 watts out
through an omnidirectional antenna, which is rather more than the
FCC's Part 15 ERP rules for WiFi will allow.

In practice, people using simple, commercially-provided "gain"
antennas with their commercial access points are probably safe
(especially if they buy the AP and antenna from the same vendor, as a
package which has been tested as a system). If you're concerned about
the potential legal risks, though, consult with a knowledgeable lawyer
(I'm not one).

> There's also a ham band that shares part of the wifi band, so we
>could conceivably run high gain high power ham to ham using wifi based
>equipment.

This does seem to be legal, as long as you're licensed, limit your
hopped-up transmissions to the small part of the WiFi band which
intersects the ham 13 cm band, and honor the ham-radio usage rules in

re ID'ing properly, no encryption for the purpose of concealing or
obscuring the transmission (which probably means no SSL), and no use
for purposes in which you have a significant financial interest.

Just be careful when working with teflon. NASA rules require that thermal
stripping of teflon wire be done in a hood because the fumes are poisonous.

Hi Robert

I'd like to know more about how well your extended range WiFi performs.
What type of antenna seems to be the most effective?
Why did you decide to not use a reverse SMA adapter like ShowMeCables
sells for about $5.00?
How do you measure "signal loss" to within a dB?

Jerry

I don't know about your friend, but most "Asperger's Syndrome" diagnoses are self-diagnoses. The number of proclaimed AS cases has gone up by a factor of 20 since 1980.

It's the trendy self-diagnosis, much the way "Chronic Fatigue Syndrome" is.

As in:

"He's a genius, but he plays Worlds of Warcraft all day in his mother's rec room because he's got Asperger's. So sad."

"I can't work and am on permanent disability because of Chronic Fatigue."

Add to this the casual self-diagnoses--or diagnoses with the help of a suitably-chosen doctor--of "Attention Deficit Disorder" (ADD and ADHD) and "Bipoloar Disorder," and one sees that society is providing many excuses for failure.

We taxpayers are expected to work harder and longer to pay for the upkeep of a rapidly-expanding number of AS, CFS, ADHD, and BD layabouts.

That was similar to my findings. The vertical seemed to have generally
better performance, esp on receive. It seemed noisier, but its possible
that that was because everything was louder. That will be another
experiment for another day. 80 meters was very interesting. There were a
few signals that were barely readable on the one antenna, but solid copy
on the other. I did not get to try it above 20 meters, as those bands
were pretty quiet at the time.

My Butternut has a fair radial system. Probably around the 32 you mention. I'm embarrassed to say that I lost count of how many I have. I'd just get a weekend free, and lay down a few more radials until my back and knees start barking at me. Nothing as nice as a full size vertical though.

Watermellons are dangerous too. If you feed one to a lab rat too
quickly, it will explode! So be extra careful when eating watermellons.

The average Joe_User, thermally stripping teflon coax at his work bench,
is not in any more danger than he is when breathing the solder fumes and
flux smoke of any other job. If it were his 9to5 job, that would be a
completely different story...

All

I now want to piggyback onto the earlier discussion as i face an even more difficult siting / grounding issue. I have just installed a 1/2 wave G5RV dipole at approx. 30 ft above ground. My shack is in the back of the house but on the second floor (effectively in the roof of the house) above the garden but due to the house design i think i would struggle to have a RF ground wire of less than 30-40 feet.

Based on above discussions should I :

1) fit a ground rod and run this up to the shack even though its a long way up along various walls

2) buy an articial ground unit such as the MFJ-931

3) forget about it and make do without a ground.

I am pretty thoroughly confused.

Thanks

Andy

That's basically what I have, except I needed a longer coax cable
between the wifi board in the computer to the directional antenna from
Hawking. And nobody around here sells the damm extension cables
anymore. But that won't stop a ham....

I haven't checked, but if you have all security features disabled (WEP
and such) and name your computer wifi setup (peer to peer mode) with
your callsign, that might be all you need to do for ID, as wifi is a
widely recognized RF standard, like packet radio.

Also no pecuniary interest material, and no indecent material.

The G5RV dipole is a balanced antenna and does not require a ground.
So unless you want one for some other reason, option 3...

The G5RV is a *symmetrical* antenna. Feedline radiation can still occur, and often does. In that case, the antenna isn't *balanced*, in the sense that the current on the two antenna halves isn't equal.

See Figs. 2-4 in http://eznec.com/Amateur/Articles/Baluns.pdf.

You need a truly balanced tuner in conjunction with the G5RV to assure balance. A good current balun, instead of a balanced tuner, might be adequate on bands where the input impedance is reasonable.

Hi Robert

I have been looking for "software" that provides read-out to show WiFi
signal strength. Can you tell me more about your "wifi utility program"?

I noticed that you intend to use a coax cable to connect the WiFi antenna
to the Computer. Would it be difficult for you to locate the Router or
access point at the antenna so the coax will be shorter?

Jerry

Jack [WN5A],

Post the Results of your "Findings" here on RRS
and become a Resource for some one with a
problem with one of the McKay Dymek Active
Antennas in the future.

And post a Copy of your Results and Findings to
the "Loop Antenna" Group on YAHOO !
GoTo=> http://groups.yahoo.com/group/loopantennas/
They are also a Resource for all kinds of Loop
Antennas Questions, Problems and Issues.

hope this helps - iane ~ RHF

There's "Net Stumbler" that will give you a time/signal strength graph.
It's what the wifi card reports.
Did a google search,found it at
http://www.netstumbler.com/downloads/

>
> I noticed that you intend to use a coax cable to connect the WiFi antenna to the Computer. Would it be difficult for you to locate the Router or access point at the antenna so the coax will be shorter?

That would actually be the better way to go, as there'd be less loss in the coax. But I'd have to change a lot of things in the physical layout of my shack...

Source record: 37770
Cross-posted to: rec.radio.amateur.antenna,alt.internet.wireless,comp.sys.laptops

I'd like to build the antenna from the following page;

http://www.frars.org.uk/cgi-bin/render.pl?action=link&url=1162&goback=1064

But there are a few details I need to sort out before I try.

1) It uses UT141, Could I sub 9913?

2) Or, should I use the copper tube method shown here,

http://martybugs.net/wireless/biquad/

3) The author states:

"Next, cut four pieces of UT141 coax 80mm long, and strip 1.5mm of outer
from each end, leaving a total outside length of 77mm. These will form part
of the phasing assembly. Follow the diagram as to the connection of these
pieces of coax. Connection of two double quads in parallel will result in an
impedance of 25 ohms."

Please view >4double quad back jpg< at bottom of page as reference.

I assume he's describing the 77mm pieces that run at a 45* angles, however
the picture does not show

UT141 coax as he describes.

4) Again the author states:

" Next for the 25ohm to 100 ohm matching sections, cut two pieces of 61mm
UT141, again strip the outer back 1.5mm from each end to leave a outside
length of 58mm. Of course 2 100 ohm coax's in parallel will result in an
impedance of 50 ohms. Connect each piece to the joined 77mm lengths as per
the diagram. Under the connector, both centre conductors from the 58mm
lengths are connected to the centre pin of the SMA socket. Solder the outer
of these lengths to the SMA socket body to ensure a good earth connection."

Again he says use UT141 but I don't see it in the picture.

I'm looking forward to your input!

Thanks, Mike

Source record: 37771

The whole idea of the OCF is to moderate the wild excursions of impedance that is so typical of a center fed antenna operated at even harmonics. I've used both over the years (OCF and Center Fed). I prefer the OCF for general use and the balanced fed dipole for best overall performance. I will say the impedance excursions of the dipole were annoying (of course, one can always employs Cecil's trick and avoid the problem completely). Cecil approach, while effective, makes the entire project more and more complicated.

For a "throw it up and use it" approach, the coax fed OCF is hard to beat. It works and presents impedances that are typically handled quite easily by even the minimal tuners incorporated into many of today's radios. I use a 135' OCF and have no trouble matching it at all (it's a CW-80 Carolina Windom). I have found its performance on 80/40/30 to be quite good.

Since Asperger's is is described as a mild form of Autism, it leaves
a lot of doors open for diagnosis. In fact any circumscribed area of
interest: cars, computers, trains, meteorology and astrononi...etc.
could be a symptom of Asperger's http://www.aspergers.com/aspclin.htm
Any nerd characteristics is certainly very suspect. Anyone who dives
into one particular subject. Doing math is certainly a health hazard.

I sometimes wonder if all this really comes from some dissatisfaction
by others who would like to get closer to the sufferer, but doesn't
quite catch their imagination. Hence it's as much other people's
problem as the sufferers. There should be an Asperger's contact
deficiency syndrome...

Wow! Tim, you may have figured where SSI went wrong - they're now accepting self diagnoses of disabilities.

Maybe we can head this thing off by requiring an MD diagnoses!!!

Hi Mike

You have given some great reference sites. Thanks.
If *I* was intending to feed two 25 ohm loads to a 50 ohm line, I'd
consider a series connection rather than transforming with a balanced line
transformer.
Besides, I didnt follow how the transforming of 25 ohms on a 100 ohm line
produced an impedance that is appropriate for matching to 50 ohms. But, I
havent studied the electrical equivalent lengths of the coax lengths.

Jerry

I don't really have a good understanding, but, looks like he has
two 50 ohm antennas connected thru two 77mm wires and then a repeat of
two 50 ohm antennas connected thru two 77mm wires. Then both sides are
connected
thru two 58mm wires to the center conductor of the connector.
(that all seems like 12.5ohms to me)
But I all ready know there is to much info missing here.

> Besides, I didnt follow how the transforming of 25 ohms on a 100 ohm line

I know he talks about 100 ohm line but I don't see any.
I hope one of the gurus helps out on this.
Mike

Hi Chris,

It sure was. I took 324 photos of the ship and the shore we cruised
by (much of it was Seattle waterfront as we passed in review). I also
focused on the external antennas.

The Bunker Hill bristles with a lot of them, including two HF
Fantails. I asked about their HF operations and the Comm Officer said
it was for ship-to-ship - if and when they did it. Lot's of other
RADARS, from the big to the small, especially the MK 15 Phalanx
Close-In Weapons System
(http://www.fas.org/man/dod-101/sys/ship/weaps/mk-15.htm)

While I was manning the rails with the CTs, the Chief pointed out a
system next to me on the deck. It was a RADAR signature sniffer that
they used to catalog the emissions (from dare I say the "enemy?").
They spent some time off the Asian coast "lurking" during missile
shots. Their gear also had the capacity to send corrupted waveforms
to confound RADARs.

>I hope one of the gurus helps out on this.

Let's start out by assuming that the biquads are each 50 ohms (which
is something you can ensure by placing them at the correct distance
from the reflecting ground-plane).

Each 50-ohm biquad is fed through a suitable length of 50-ohm
semi-rigid coaxial line. Since the antenna's impedance matches that of
the coax, there will be a 1:1 SWR on the coax, and the same 50-ohm
impedance will appear at the far end of the coax. In this particular
case, the semi-rigid coax will consist of the part which goes through
the reflector (supporting the biquad) plus the trimmed 80mm section
(which ends up being 77mm after stripping and soldering).

There are four such 77mm lengths, which come together as two pairs.
At this point, each pair is soldered together, placing two 50-ohm
loads in parallel. This creates a 25-ohm load.

Now, each 25-ohm connection is soldered to a further length of 50-ohm
cable, 58mm long plus a bit for making the connection. The two 58mm
sections come together, at the SMA connector.

These 58mm sections act as impedance transformers. One of the useful
characteristics of a coax which is 1/4 or 3/4 or 5/4 electrical
wavelength long, is that it transforms a resistive impedance at one
end, to a different resistive impedance at the other... and the
geometric mean of these two impedances is equal to the characteristic
impedance of the feedline.

In this case, if you have a 25-ohm impedance at one end, and the cable has a 50-ohm impedance, then the impedance at the other end of the cable will be 100 ohms.

This places two 100-ohm impedances in parallel where they're connected to the SMA jack, resulting in a 50-ohm impedance.

In the case of this particular design, the impedance-matching sections (58mm) aren't actually the 3/4 electrical wavelength that one might expect. UT141 has a velocity factor of 0.7, and my slide-rule calculation suggests that they'd be around 65mm long for a true 3/4 electrical wavelength at 2.4 GHz.

I would guess that the biquad antennas aren't exactly 50 ohms resistive, and that this impedance is being transformed somewhat by the 77mm sections, and that the length of the final impedance-matching section has been hand-tweaked to 58mm to give the best practical match to 50 ohms (and thus SWR) for the antenna and phasing system.

That being the case, I'd probably recommend trying to reproduce the antenna design as-published. If you switch to a cable having a different velocity factor, you may need to do some cutting-and-trying to get the right impedance match.

I got some help offline (thanks Dave) the wires I thought were solid are
actually

a coax (UT141). It make a little more sense now.
Mike

Although not unheard of, FEP is less commonly found in cables than PTFE.
Do you have a link for the PTFE hazard sheet?

Both are Teflon, which is a DuPont trade name for a variety of related
materials.

Thank you for that clear explanation.
And regarding the distance from ground-plane, I've seen two different specs one 30.5mm and the other 18mm.
Thanks again, Mike

> Let's start out by assuming that the biquads are each 50 ohms (which

Tim May - you are an idiot!!!!!!!

Where exactly do you get the "most AS diagnosis are self-diagniosis"
from?

Your head?

LOL :-))

That's not the way to do serious research.

All the people I know with AS have an official dx by recognised
clinical psychologists specialising in Autism and Asperger's.
Including myself.

why don't you just say you're jealous and be done with it?

:-))

I believe that those two distances are optimizing for different things.

If I recall correctly, the 30.5 mm spacing is optimizing the antenna
for gain (the sharpest forward-looking lobe, likely).

The narrower spacing seems to optimize the design for the best
impedance match (the biquad is very close to 50 ohms in this version).

-

THEY GANG RAPED A FOURTEEN YEAR OLD WHILE CARRYING LOADED
WEAPONRY

AFTER RAPING THE CHILD IN FRONT OF HER FAMILY - THEY SLOWLY
MURDERED EVERY SINGLE ONE AS INNOCENT GOD LOVING HUMANS

- but -

BUSHITE AMERKA CLAIMS THIS DOESN'T WARRANT THE DEATH SENTENCE?

Again, evil bushite THIEVES claim they are justified when
indiscriminately bombing populated cities to MURDER US People.

General Johnny would teach MY soldiers to immediately arrest
to kill for such criminality. In fact, I'd likely even throw
in some bonus cash, an a Freedom medal from all lovers of
Liberty. Did you know, many bushite sing a song about killing
innocent young girls for pleasure? Did you know that also, an
"American" radio host likes playing that same song as recorded
on "American" airwaves? Fight back for God, or die from self
contempt my friends, fight back for life and love.

Again, evil bushite THIEVES claim they are justified when
indiscriminately bombing populated cities to MURDER US People.
All to help 'escape' the neocon ENEMIES of America - they also
support "officially" destroying Our public infrastructure,
thieving humanitarian aid, while incarcerating innocent people
to collectively be punished by the TRULY Satanic enemies of
GOD. Ten "CIA" bushite enemies have been found to have
kidnapped near one thousand innocent Americans to be tortured
to death, in tyrannical nations friendly under American funding
by Bush unquestioningly. Fight back for your neighbor, fight
back for America, fight back for YOURSELF. Or, don't.

See the bushite, you bill it for Christ, You bill it for America, You bill it for them, you bill it for US.

Murdering bushite gang rapists try escaping true accountability

http://womensspace.wordpress.com/2006/07/09/rape-of-the-hadji-girl-part-3-five-more-us-soldiers-charged-abir-hamzah-was-14-years-old/

/ / Why did the Army, within three hours, return to tell neighbors that this was the work of "insurgents" apparently without any investigation? \ \

See? in Johnny's world, that "the Army" person would have been the FIRST questioned, then likely arrested. But look, it hasn't even been acknowledged as evil doing in progress. (Every time you read, "The Army says..", become aware.)

It should be noted, ungodly bushite enemy commanders call every car bomb in Iraq, al-Qaida, without even pretending to do freedom operations for YOUR protections, as just another dead body in the rubble. (Likely caused by Aegis for cash profit.) So then, look my friends, Amerka refuses to demand justice to save the lives of their very own sons and daughters. And when, WE, Humanity, beg them to answer our calls for accountability, they refuse but for to LIE, stating publicly, "God" would grant robbing from innocent others, to enrich their great unholy tyrannical demon liar. They know easily that the bushmob did 911, and they like it. No, they crave it. The chance of murdering their own "loves" to enslave the human race for the antichrist, sounds great, just as long as they can get themselves in on the take.

/ / Idiot General Says Dead U.S. Troops Best Reason To Keep War Going And Kill More U.S. Troops

[Option B: More Dead U.S. Generals And Fewer Dead U.S. Troops ?] \ \

If the sacrifice of soldiers lives is going to mean anything, it going to mean how long it took, Americans to care for themselves as really worth something. When, or if that day should come, it will be the day where Iraqis victims are seen, as just you or me. Today, there is nothing more i wish, than to hear bushite nazi savage thieves for the neocon die rightly, before the innocent they target for murder. All in an attempt to 'escape' those truly responsible for the crimes of 911 a bushite whore practices, as an enemy to Christ and America.

Just look at that my friends of Earth just look at that. Americans speak only contempt for the value of human life. Every day, INNOCENT Iraqis die by the criminal actions of the demonic neocon enemy forces of EVIL, and our deaths as the god loving mean nothing. A small few die in a bridge ACCIDENT,

and every corporate channel devotes the entire day's news as it. Allawi confesses to killing children for "CIA" money, and there, as with the soldiers who braggingly, beat innocent children to death for sexual pleasure, bomb people indiscriminately, or steal all the humanitarian aid, don't command your slightest concern as impartial paying for it TV viewers. They say, US people who aren't "Americans", do not deserve due process, the freedoms they claim to own exclusively, of which WE, are granted nothing of. See?, by not using evidence to from your guilty verdicts, how can it be therefore possible, to know, you've arrested, tried, then executed a mass murdering NEOCON war criminal? I don't think Americans could possibly be more disrespectful to God and country, Johnny and Justice right now, do You?

http://existentialistcowboy.blogspot.com/2007/06/911-culprits-why-towers-really-fell.html

/ / We know that a crime was committed on 911. George W. Bush, of course, quashed all investigations before they could begin. Since when are crimes not investigated? [...] It is not too late, however, to begin such an investigation. There is no statute of limitations on mass murder. \ \

We, as Humanity, have to rise against the neocon LIAR enemies who forsake the value of Human life. Death to the bushite, death to the enemies of America's America.

/ / Army Secretary Pete Geren asked a military review panel to decide whether Lt. Gen. Philip Kensinger, who led Army special forces operations in Afghanistan after the Sept. 11 attacks, should also have his rank reduced. \ \

A bushite demon CAUGHT aiding and abetting the crime of FIRST DEGREE MURDER of a trying to be Patriot Soldier, is made to fear in bushite amerka, he might face a reduction in rank! MURDER~!

/ / Congressman Dennis Kucinich, a member of the House oversight and government reform committee, which has been investigating war contractors. "There's no democratic control and there's no intention to have democratic control here." \ \

Right. The demonic lawless actions of Aegis posing as al-Qaida killing police officers undermine freedom for Iraqis and Americans, alone with ALL the rest of US. All criminally gotten assets of lawless mercenaries will be hunted by every police service; those that complain as traitors to Freedom as Justice, WE, the real Patriot warriors, committed to defensive measures, will be rewarded to bill for. IF! Johnny is recognized a Mythical King with money to spend better than a neocon saboteur. Your call... Reminder: The neocons in YOUR power, were never elected, nor, was Bush the demon enemy of

all Human Life. A demon that says if you disagree with his blind blanket statements against innocent Life, YOUR a terrorist. At least with GOD, we'd be only killing criminals we couldn't otherwise defend ourselves from with evidenced conclusion through practiced Law judged fairly.

http://www.guardian.co.uk/Iraq/Story/0,,2138917,00.html

/ / TheSpyWhoBilledMe.com regularly breaks news on the clandestine world of private contractors and US intelligence, recently established that Washington spends $42bn (£21bn) annually on private intelligence contractors \ \

do the math - do the math - do the math - do the math

42 billion. 42 thousand million. Or, hiring maybe twenty or thirty bushite LIAR enemies, who blindly giving Americans pay not only billion dollar saleries, but also with their forsaken lives as unworthy of real protections. CNN, CBC, and FOXNEWS knows the bushmob did 911. [Nazi zionists suck!]

So, million dollar saleries? I doubt. Likely a neocon enemy or two robbing from an undefended America. Remember, Peter Power wants US to believe ALL of Scotland Yard would murder Brits for stolen bucks. Frankly chaps, I just refuse to believe such bullocks.

Be me man,

King Johnny Wizard

-

The Ground Truth
http://www.informationclearinghouse.info/article15319.htm

The part where pro-bush "American" soldiers drive over children to kill them for fun, all because they say our Humanity let's those responsible escape retribution for being Satanically evil as enemies to Christ, left me angered beyond words. While CNN, CBC, and FOXNEWS couldn't care less for those children, but will tell us, these 9 accident victims must rule, so far, two full days of wall to wall coverage. "Pro-Western" Allawi blowing up school buses for "CIA" money? Who cares? Really who cares in TV America for defending OUR children's lives I'm saying? Get me in the news my brothers and sisters, and I'll make the best of it. Just do it. Fear not for my life loves, fear for your life left to silently die in contempt for Humans being.

Thanx much.

-

"He never would have called me 'sniveling,"
http://www.democraticunderground.com/discuss/duboard.php?az=view_all&address=389x1466466

/ / "He never would have called me 'sniveling,"' O'Neal said.
"I don't remember ever speaking to this chaplain, and I
find this characterization of Pat really upsetting. He
never once degraded me. He's the only person I ever
worked for who didn't degrade anyone. He wasn't that
sort of person."

The chaplain's name is blacked out in the documents. \ \

-

Jeeze, nobody tell Chris what CNN is reporting

MSNBC'S CHRIS MATTHEWS :

" So, the longer we stay there.. do the number of people
in al-Qaida grow or become lesser? Aren't there more
al-Qaida every year?... Because if we stay there four
more years.."

Jeeze, nobody tell Chris what CNN is reporting, where
the murder of innocent people outside of Baghdad makes
the neocon soldiers appear as Heroes, all because they
can blindly blame the CRIME on al-Qaida without even
the slightest inquiry. Catch this Revelation, among
many others, in one of many miraculous Mr. America,
Johnny Wizard Podcasts. Get your copy before they're
all gone!!1 Haahahaheh.. boy I'm I ever one hell of
a great guy.. know..

Love yeah!,

President and CEO
of Sharewhere Earth Co.
King Johnny Wizard

-

"I just brought TERROR to someone else, under the "American"
flag, and that is just not what I joined the "American" Army
to do." - dying needlessly for the enemy of GOD antichrist
responsible personally for the treasons of 911 with his
zionist neocon partners of EVIL.

-

/ / President Shimon Peres has called on the world to unite
against Iran and to force it to abandon its nuclear weapons
program. \ \

Let Jews of the World rise to demand Peres "The Devil", be
put to death for alleging a FALSEHOOD to murder Humanity
for our stolen religious values. Peres is the actual Devil.

No, seriously. I am as surprised as anyone.. No, seriously.

Signed,

Poor Jew Johnny, the richly Magnificent!

/ / DCI said the children confessed to the charges
brought against them after extended periods of
interrogation, which occurred before their court
appearance. The report includes personal testimonies
from children that expose physical and sexual abuse
at the hands of the Israeli army and brutal treatment
during lengthy periods of interrogation. At the end
of the interrogation process the children were told
to sign papers, despite not knowing what they were
signing. \ \

Realize: American tax payers fund this unquestioningly.

-

http://www.talkleft.com/search?string=haditha

All military "Judges" must be arrested for TREASON, tried on
the decisions they've made as unqualified. And on those
decisions unjustified, as on the charges of murder, THEY, will
be put to Public Judgment for a death sentence gloriously for
freedom and country, I will be assistant Prosecutor, who will
speak facts, unlike bushite, who calls every "foreign fighter"
al-Qaida (except the REAL General Mahmoud Ahmad) - and bombing
victims "SUSPECTED" women-loving-child-schooling-Taliban.
Death to the bushite my friends, death to the bushite enemies.
These demon nazi fukers believe that those who bomb cities
indiscriminately, wouldn't be put to death for the defense of
our communities in Christ. I, Christ, intend to change that
by example. Americans will pay $25,000 a head for every nazi
bomber, or those who fly in the Apache, captured, tried, and
put to death as the Satanic bushite enemies of Creation. Kill
a bushite today why don't YOU lover of GOD as Just Causes to
save Our dying Universes? Those who victimize ourselves as
the innocence of Humanity, are going to answer to US
scientifically. Death to the bushite, death to the enemies of
America.

-

The King of America - Citizens Face Full Asset Seizure

http://www.rense.com/general77/asset.htm

/ / "(ii) to have materially assisted, sponsored, or provided
financial, material, logistical, or technical support for, or
goods or services in support of, such an act or acts of
violence or any person whose property and interests in

property are blocked pursuant to this order; \ \

So, those who don't support the return of all stolen monies from Iraq, who continue to undermine Humanity's chances for Justice in Iraq, (like every neocon LIAR and foxnews broadcaster, lawless mercenary antichrist disciple, or Haliburton shareholder,) needs their assets seized, and tried publicly for treason as war criminals. Every war profiteer holding more a one hundred thousand dollars will be hunted by the will of Humanity. so says - The Son to God as Man to men.

Bush To Veto Ban On Mercury In Vaccines
http://thimerosal.worldwidewarning.net/www/archives/59

/ / "Under the current administration, mercury has been and will continue to be knowingly injected into the youngest of American citizens. The controversial mercury-containing preservative thimerosal has been linked by thousands of parents as being the cause of their children's mercury poisoning and autism." \ \

Please, I beg you as the Son of Man, to fight back against those who threaten the lives of innocent American children, by forbidding defenses for US, the People. As recognized King of my forsaken World, this wouldn't happen I'm telling you. Support my rise to tax every American ten cents to start up my company of accountability. Running on free open line communications where ANYONE CAN CALL US, and call me a Jerk, just don't expect I wont fairly defend myself. Live broadcasts out in the fields, trumping evil demons by the power of the word. These individuals responsible for criminally victimizing American children, need to be arrested from continuing their action against our families. Support US please, to work on Just causes for the betterment of the human species, Or don't and die unworthy you bunch of bushite nazi savages.

We Have A Problem Here

Look, Bush closed investigations on 911 immediately, then started firstly on Iraq, for war mongering thieves, with General Ahmad escaping un-accosted for the neocon enemies. Not relevant? Your Constitution is laying undefended, a National act that can not be done by any other terrorist group but those who claim your freedom rights denied by bushite command. Not treasonous? Look Condi, the demon 911 nazi witch PERSONALLY assisted in dropping more than seven million land-mines on Lebanon indiscriminately in Your terrorized dying names. Hate Life and God as yourself do You?

Don't anyone be deceived that the neocon enemies minimally assisted these crimes by refusing to allow US pursue the evil

doers by following the actual crime scene leads, but we lack REAL leadership skills that are naturally required to see molten Iron flowing like water from the 911 towers on YouTube. Oh golly gee, who is that theatrical man from Canada with all the answers on Justice for Peace with Freedom Ruling Supreme? with atheists and everything? A brilliant man given next to no chance at receiving acknowledgment in Bushite media amerikan impires.?

Ray McGovern on 911 broadcast nation-wide on the coast to coast radio network "What we need here is an investigation. There are answers out there, but no one has pursued the answers." Similarly, there are questions that we isn't [allowed] figuring.

"No one has pursued the answers"? Come on Ray, don't tell US, you have no internet access, or haven't seen the video of molten iron flowing like water... blahblahblah

http://www.peaceandjustice.it/impeach/

/ / Executive members of the American Israel Public Affairs Committee lobbied Congress to pass Iran sanctions bills. \ \

These DEMONS need to be arrested, tried, and EXECUTED for TREASON. There is no evidence against Iran to substantiate their DEMON LIES to murder millions of People for the pleasures of the sadistic zionist enemies of Human Life, enemies of GOD as LOVE. Just because repuglicons like Liebermann, take bribes to murder US folks as the innocent, doesn't legitimize their treasonous conduct against YOU, my freedom loving dying brothers and sisters. Stand up for Jew Boy Johnny why don't You.

Who as America will bother to care they die by naked zionist criminal command? Johnny Wizard has been screaming for help to America, begging them to pick up their phones leastly, to air concern for the survival of the Nation, for YEARS! to publicly challenge happy happy, joy joy pro-child killer demon enemy George Norry and bullshitter no-national thief of Life Art Bell, and they've near completely refused while laughing and singing by 'who cares for you' zionist news command. They, as America's Coast to Coast voices, would rather richly die YOU sacrificed for CRIMINAL zionist Israel, (Israel, where the government leaves actual Jews to die in the streets starving as garbage dumps, to make it look good for MORE giving American charitable donations to disappear elsewhere) before saving the lives of THEIR VERY OWN. Americans don't seem to care they die by their own unwillingness to communicate openly for Justice. I ask you again, to spare me a few dollars so I can feed myself. I am actually, near starving, and never in my most feared nightmares, thought this

world, with our communication technology, would leave me without any financial assistance. I seriously need to eat. Please help me, by supporting our cause to not starve to death. If you appreciate my words in defense of the once great Human race, donate a few dollars to this cause. Justice and Freedom for all, especially God as Just, and worthy our praise

Peace.

FEMA covered up toxic danger in trailers given to Katrina victims
http://www.wsws.org/articles/2007/jul2007/fema-j21.shtml

I'll tell YOU again, CBC, CNN, and FOXNEWS knows the bushmob did 911, and lie to you entertainingly to sacrifice even more of US to the demon antichrist forces of evil.. While I ABSOLUTELY destroy bushite with joy for God and the defense of love.

/ / Support me, or fail to recognize true wisdom when it speaks to you of need for desperate change to save your dying selves. No evidence against an accused is US being truly abused.

"These are not terrorists, they are not al-Qeada, they are ordinary innocent men, women and children." \ \

-

TRAITORS TO LIFE

"I told him, there's women and kids in that room," Lance Cpl. Humberto M. Mendoza said of Lance Cpl. Stephen B. Tatum. Tatum's response was, "Well, shoot them,"

If Americans don't proudly put to death Tatum, on behalf of the Family that lost their son, their Marine, Johnny will formally conclude, Bushite america is an ungodly evil nazi fascist state of intolerance and hate to US, the Great Human Race. Bushite amerka does not own Freedom, nor do they own our rights to be Just. Join me in demanding the Public execution of the satanic demon liar Tatum, on his Public insistence that murdering innocent families to thieve from for the neocon, is a crime not warranting the death sentence enforced by any family man. Death to the bushite. death to the enemies of man. The neocons will be arrested, tried, and executed for the crimes of 911 as traitors to Life.

Bush Outlaws War Protest - Citizens Face Full Asset Seizure
http://www.rense.com/general77/asset.htm

"Who cares? to listen to a dying unheard America",
as the growing richer ungodly neocon enemy traitors shrill.

-

Death to the bushite instead of the innocent loved in God

/ / IntelCenter issued a tacit warning that the footage may be re-hashed when they released the "new" tape to the media, but they failed to mention the fact that they released portions of the exact same clips in October 2003. \ \ amazingly - I witnessed blurred-out faces of those they claimed al-Qaida in another instance just recently. (Then, look at the dog fight vids that CNN and CBC refuse to show the dog haters faces in..)

I say American taxing payer folks, flip me some dollars, and I'll pay out rewards - after a moderate lunch - all to take these IntelCenter AL-QAIDA! - AL-QAIDA! - AL-QAIDA! straight to public trial, then public execution for high treason - like holy fuk mon let's get real here People. Or don't and we die further for bin Laden's fear of cameras. Offer a 500,000,000 dollar reward for Zawahererri's crew to get the rest of this done quick like. I wanna rock! Death to the neocon enemy LIARS, death to those who WAR - WAR - WAR innocent Humanity for the continuing bushmob's escape plan from nowhere. See? Heaven or Hell? YOU DECIDE.

Don't EVER forget, the private company Aegis has been officially found dressing up as AL-QAIDA! - AL-QAIDA! - AL-QAIDA! to murder pro-western forces in Iraq, while desecrating Elvis. Elvis Presley. If you don't love Elvis, there is something seriously wrong with America. Now yous messing with a real son-of-bitch. HeY!, question: why don't Americans kill a bushite for Yourself bud? - because Bushites insist "we're" willingly being led by the antichrist enemy of all human life as Satanic LIARS who intend to cheat ourselves of freedom through self respect. Pro-neocon-media enemies are nazi savages, and I don't like it..How about you?

Death to the bushite instead of the innocent loved in God

-

Time is Up

Al-Qaida Kagan "Al-Qaida, their whole strategy revolves around generating sectarian violence, because that is how they embed themselves within local communities "

What?? For friendship?

What is the demon TRAITOR to HUMANITY in America saying about the reasons he embeds an Iraqi under 50 odd divergent NEOCON labels? Wouldn't most Al-Qaida take great joy in killing a bushite nazi grunt like any real Family man would also? These LIAR dumfuk grunts who cheer "whore yeah", routinely, can barely read or write, so, how possibly does this FOXNEWS expert, expect such ungodly antichrist forces to delineate

Al-Qaida from the local communities they PROVABLY indiscriminately bomb as Satanic?

Kristol and Kagan: 'Put Everything' Behind Escalation So We Can Bomb Iran and Syria

Kristol and Kagan MUST be put to death for treason against America, treason against Life, treason against GOD. They both have continued to Publicly advocate murdering more innocent peoples indiscriminately they call, "Al-Qaida", all to rob further monies from an undefended America. It is easily learned by any as all, the victims of bushite tyranny are exclusively, US, The People, guilty of nothing but our shared love of GOD. Remember forever: there was NO JUSIFIED REASON for bombing PEACEFUL Samara, NONE! that bombers confess was done as ordered by Allawi INDISCRIMINATELY, all for getting killed Marines sent in later for more stolen cash from America. P2OG. [hundreds of bushited Marines died rightly almost immediately - (wow eh?)] A Satanic action, Kistol and Kagan, both blame without thought to question on "Al-Qaida".

The action of Satanic bushite bombers targeting Samara as war criminals is FULLY documented.

Death to the bushite neocon LIARS, death to the enemies of Freedom for Humanity. My beloved friends of GOD, please, when you see the mute bushite, kill it for Christ, kill it for Love, kill it to defend your loved family. (Any soldier who doesn't proudly talk of how it hunts those British soldiers who kidnapped barefoot children and victimized them on video, is a soldier worth destroying NOW to defend GOD and Life from needless death.) I HATE the REAL demon antichrist Christ says.

Kagan "You rarely know in the middle of a war, what the outcome will be."

Johnny Wizard the Creator "I win."

-

/ / The US has also been backing some pro-western politicians like Iyad Allawi \ \

Do you know who Allawi is? Allawi confesses to blowing up school buses filled with children for "CIA" money. NOT THEORY. HE ADMITS IT AS AN ACTUAL SATANIC DEMON! Allawi, the truly insane mad man, confesses to having ordered the murder of doctors and nurses that treated wounded god loving women and children from Fallujah. It was these DOCUMENTED acts that had him thrown out of 'the CBC, CNN, and FOXNEWS TV expert scene as workable', all for fears that US humans might actually wake the fuk up on WHO is Our True Enemies here. All three, pro-private-bank zionist news stations are well aware

that the bushmob did 911, but lie to YOU as forsakenly dying
for their growing riches and world wide broadcast fame.

CBC National Newz - July 11th 'tens of thousands have died in
Iraq since the war against truth started.'

Anyway, these two Allawi incidences are fully documented, look
it up, then demand the "The US" pro-western politician person
quoted as supporting Allawi - be found guilty of CRIMES
AGAINST HUMANITY, Demand publicly, having the neocon zionists
EXECUTED by America, for America, as America. A Just America
that defends America from criminal madness. Or don't. Death
to the bushite, death to the enemies of Man I say.

-

ABCNEWS.com : FBI Called off Terror Investigations

A question Johnny Wizard has for America: Tell me, is
this not a treasonous act - for Bush to close criminal
investigations, immediately after the terrorist crimes
of 911? Shouldn't the demon enemy be put to arrest
for that godless act alone in this forsaken dying world?
A world left instead suffering further the tyrannies
of the war criminal ENEMY of all Human Life?

A refresher: the neocon will tell you openly, they live to
lie to the Public for cheating and stealing by murder of
US, innocent peoples purposefully enslaved by a made
ignorantly entranced TV audience that is repeated reminded,
we have no power worth respecting.

CNN, CBC, and FOXNEWS aren't taking are calls presently,
but just lie and tell US they do. Look to see, almost all
political internet traffic condemns Bush straight to hell
well he rightly belongs, but the polls still say no - WE,
seeking for Just cause, are the minority.. just roll over
and die for the neocon betrayers to god and country, life
and loving.

-

George Bush "The same folks that are bombing innocent
people in Iraq were the ones who attacked us in America
on September the 11th"

George Bush 'Iraq has nothing to do with 911, you bunch
of nazi dumfuk grunting LOSERS. Whore yeah - praise Satan
- die America die. I mean... I love Jesus'

So it was as I thought too: the direct co-operation of
the joint chiefs of staff assisting General Ahmad, in
committing the murder of thousands in America on 911
for the neocon TRAITORS, as the same 'escaping' enemies

today, responsible for 'secretly' ordering these
indiscriminate terror attack bombings against YOUR
Humanity for their continuing stolen pleasures as
Satanic.

-

/ / U.S. Marines are said to have killed as many as eight
unarmed Iraqi prisoners when U.S. forces attacked Fallujah
in November of 2004. \ \

HA! Trying to ignore the murder of more than 200,000 People
as if OUR lives have no real meaning. WE KNOW they murdered
everyone they could in around between 15-55, but went ahead
gunning for infants and the elderly too under Sattler. Look
it up. Death to the demonic bushite LIARS, death to the
enemies of Man, so says the Son to God as Man to men -
Kill the dishonorable bushite enemy and be Loved by all as
Savior.

-

DEMON MURDERER PETER POWER TRIES TO LIE HIS SOCKS OFF
ABOUT HOW HE MURDERS LONDONERS AS A FOR REAL TERRORIST
RECRUITER

[letter written as signed by Peter Power to MSNBC et al.]

/ /It is confirmed that a short number of 'walk through'
scenarios planed [sic] well in advance had commenced
that morning for a private company in London (as part
of a wider project that remains confidential) and that
two scenarios related directly to terrorist bombs at
the same time as the ones that actually detonated with
such tragic results. \ \

Little Peter Power is threatening literally BILLIONS
of US there. So.. what we a going to do my partners
in living? Die or survive? Your call...

-

Petraeus quietly urged his commanders to "get the word out"

Homeland Security Committee Chairman Bennie G. Thompson

/ / Thompson continues by asking Chertoff to further explain
what measures the country should take based on his instincts,
"What cities should be asking their law enforcement to work
double shifts because of your "gut feeling?" Are the American
people supposed to purchase duct tape and plastic sheeting
because of your 'gut feeling?'" \ \

Homeland Security Committee Chairman Bennie G. Thompson

NOTE: Americans are literally paying billions for Chertoff's
THREAT of "gut feeling". Billions, while the neocon walk
away from MURDERING Americans on 911 with the bushite on
America's Coast to Coast radio network, claiming they don't
know you know, nor, ever will. They'll tell you, blame the
shadows in the New World Order, but don't rely on evidence
to form your conclusions on who PERSONALLY is responsible
for criminal actions against YOUR rights to be free as
alive. Evil is real my friend, evil is real. Death to the
bushite, death to the enemy LIARS of human kind. Death to
the enemies of Love and God. Death to the enemies of Life.

"A dead Iraqi is just another dead Iraqi... You know, so what?"

These demons are murdering god loving people as enemies to
Humanity with the nazi assistance of corporate news america.
Will YOU please, support my rise to speak publicly challenging
anyone who disagrees with me, GEORGE WALKER BUSH needs to
be arrested immediately for 911. Peter Power needs to be
arrested for the London bombings. Sattler, Blount, and Russell
need to be arrested, tried and put to death for WAR CRIMES
against Iraq, along with those responsible for other
indiscriminate targetings against innocent PEOPLES for
the zionist neocon god betrayers hidden in shadows as
the un-known "Joint Chiefs of Staff" demon enemies.

Fight Back for Christ Sake God Damn You

http://mediamatters.org/items/200702260008

/ / Wash. Post parroted White House claim that Iraq war was
authorized by U.N. Security Council \ \

Treason charges must be sought against zionist reporters
who LIE with such blatant disregard for your freedom in America.

-

The fascist control bushite, don't like You to think
independently for Yourself, for we independents out here

make them look as stupid as they are. Thank you very
much for that not so secret info.

-

The Other War: Iraq Vets Bear Witness
Chris Hedges and Laila al-Arian, The Nation

/ / Many said that these acts were perpetrated by a minority.
But they nevertheless described such acts as common and said
they often go unreported - and almost always go unpunished. \ \

/ / In addition to this sadistic and prolonged torture of the
innocent,
according to Gush Shalom, (Gush Shalom is a Jewish peace movement-
true Judaism is opposed to Zionism) \ \

Moore vs. Greed
http://www.crooksandliars.com/Media/Download/19156/1/TSR-Moore-Wolfie.wmv

Moore: "Why don't you [at CNN, CBC, and FOXNEWS] tell
the truth to the American people?"

Because as zionists, THEY hate a liberating people who want to
TRULY make their lives better by understanding Justice is Freedom.

-

"Al-Qaida" = "General Mahmoud Ahmad" = "bush's ungodly partners in
crime"

Why will you not as a member of Humanity, make the call
to the Coast to Coast radio network of demon evil nazi
savages who deny your legitimate concern be addressed freely?
Hate God and Love do you? Couldn't care less could you
for the giving lives of ignorant Americans as an American?

Death to the bushite, death to the enemies of Man.

-

http://www.liveleak.com/view?i=456_1177473318

/ / An [BUSHITE ENEMY] American soldier boasts of having tortured
[INNOCENT] Iraqis and making a 15 years old Iraqi girl commit
suicide after she had been raped. \ \

Tell US, who wouldn't take great pride in warring this boastful enemy
of Humanity? Or, are you like CNN, CBC, and FOXNEWS would suggest, it
is heroic - for all are heroic who DIE for the neocon?

-

/ / It is strange that the 'Secret Organization of Al
Qaeda in Europe,' the group that is allegedly
responsible, would have escaped notice (to say nothing

of their odd, 'double secret probation' type of name). \ \

Bushite are EVIL to all, as enemies to Human kind.
During Katrina, the bushites responsible for protecting
America, slaughtered everyone's confiscated pets for joy
and happiness. Three schools filled with hundreds of
dogs, cats, snakes and bats. There was no need to kill
everyone's beloved pet, but as the bushite will FREELY
tell YOU, it was fun to serve demonically as the
antichrist enemies of God and love. demand Justice for
God, demand Justice for Johnny.

/ / The mere fact that one can deduce a motive for a
person or a group does not mean that they perpetrated
the act...and it hardly suffices as proof of anything.\ \

Just try telling that to 'why work to make life better'
CBC, CNN, or FOXNEWS censors. Look at me!! They refuse
to acknowledge my documented info as REALLY important
to your continued ACTUAL survival.

Who fuking cares right? Certainly not the enemies
of America at the Coast to Coast radio network, who would
kill Americans for the rich neocons without question. It's
JUST American kids getting conned to die as bad guys.

-

DEMON LIAR George W. Bush "The larger point is, and the
fundamental question is, did Saddam Hussein have a
weapons program? And the answer is, absolutely. And we
gave him a chance to allow the inspectors in, and he
wouldn't let them in."

-

Afghan civilians caught
http://www.chicagotribune.com/news/nationworld/chi-civilians_bdjul08,1,3303701.story?coll=
chi-newsnationworld-hed

/ / The men told the same story, of how foreign troops
bombed their villages long after the Taliban fighters
had left, how the bombs killed women and children, goats
and sheep \ \

-

A quote from King Johnny Wizard, President and CEO

/ / Worried I'm going to love Life as truly honorable,
and Greater than those who openly lie to our soldiers to
have them unjustly die for no better good or reason
understood? \ \

God and America hate the bushite demon liars

http://www.commondreams.org/archive/2007/06/30/2234/

/ / NATO bombardiers thousands of feet above the ground
certainly don't know anything about the reality of the
towns and villages - and human lives - they are
destroying. \ \

-

'Up to 80 civilians dead' after US air strikes in Afghanistan
http://observer.guardian.co.uk/world/story/0%2C%2C2115846%2C00.html

/ / Witnesses claim a village in British-run Helmand was
bombed for three hours \ \

BUSHITE, THE ENEMY

It is not just a Muslim who sees the bushite as an enemy to
Humanity. These lawless savages have been acting without
accountability to anyone, because they are largely enemies of
America, who cowardly run from responsibility in America to
defend their own brothers and sisters from the neocon, and die
instead as/with rapists, torturers, and THIEVES.

"Al-Qaida" = "General Mahmoud Ahmad" = "bush's ungodly partners in
crime"

/ / How can those who want accountability be termed
anti-Iraqi? only through cowardly liars, is an American
told America's not going to hunt down those who stole in
their names as neoCONNED for dying. \ \

/ / Israeli officials have told us that the Finance Ministry
is budgeting basic social services at a percentage of their
known costs \ \ EVIL BEYOND WORDS. KILLING JEWS FOR MONEY.
We can really be something greater, while a murderous bushite
thief, a LIAR, can hardly read or write Liberty without
flinching from self contempt.

Jesus man, do I truly hate these zionist nazi thieving LIARS
on our magic TV shows who con our kids to die as bad guys.
How about You?

These naked LIAR enemies who bank to thieve more from Iraq,
Afghanistan and America, must be brought down by Humanity's
ultimate triumph over tyranny through Law. A just law, where
those accused without any evidence are Innocent, and WORTHY
yOur defenses.

What Freedom do bushite war the innocent for to rape, pillage,
and murder as blind neocon followers of the 'lawless' demon
antichrist? Eh?

-

http://www.msnbc.msn.com/id/19461815/

/ / This paints the congress into a corner, because when Bush
and Cheney refuse to comply with these subpoenas, congress will
either have to impeach, or admit we are a dictatorship. \ \

VIDEO: Massacre of Palestinian Women and Children
http://globalresearch.ca/index.php?context=va&aid=3798

-

Israeli High Court permits torture of Innocent Humans
http://www.guerrillanews.com/headlines/14593/High_Court_permits_torture_of_Palestinians

/ / Israel has illustrated contempt for law and the value of
human life, or even possessing an ethical standard of moral
behavior with respect to civil and human rights \ \

Of what religion to any GOD, is this ZIONIST nazi
behavior condoned? Demonic thieving bushite enemies of
Man lie about such behaviors bring about 'freedom', but
who of US wouldn't kill such contempt to save the lives
of Our innocent beloved families? A bushite kidnaps
Iraqis routinely, (or orders the murder of those between
15-55,) and what of any real man present, doesn't
immediately arrest or kill such CONTEMPTIBLE bushite

loyalists to the ungodly enemy antichrist?

OBSTRUCTING JUSTICE FOR AMERICA

Tony Snow "The executive branch is under no compulsion to testify to Congress because Congress, in fact, doesn't have oversight abilities."

IT LOOKS like they are going to attempt making the move of BLATANTLY TREASONOUS war criminals acting to measurably now destroy yOur Freedoms in godless America. The Satanic neocon's 'faith', is in that YOU as an American, will watch the same corporate drivel that offers next to nothing to empower YOURSELF to speak Justly for a dying America. Instead of demanding 24 hour, wall to wall news coverage, of war criminals going down one by one by the will of Man to Justice, CNN, CBC, and FOXNEWS will broadcast your blind 'belief' that you are only a impartial viewer, who doesn't really care about dying right in front of yourself for the zionist's riches, and great worldly power of tyranny through lawless nazi bushite censorship.

"Al-Qaida" = "General Mahmoud Ahmad" = "bush's ungodly partners in crime"

Jesus man, do I truly hate these zionist nazi thieving LIARS on our magic TV shows who con our kids to die as bad guys. How about You?

/ / If Bush and his PNAC buds are innocent, then Investigate 911! What have innocent people to fear from a fair, complete and real investigation? \ \

They are guilty, so, of course, the demon Bush enemy, OBSTRUCTED JUSTICE FOR AMERICA.

I hear the national radio program Coast to Coast is still feeding us neocon lies. Why don't you make the call for Johnny.. believe in yourself for a change why don't you?, buddies??... I am Your god king. King Johnny I am. Champion of Universal Life! Not enough? Who cares?, to allow US speak on our broad casts as legitimate? Worried I'm going to love Life as truly honorable, and Greater than those who openly lie to our soldiers to have them unjustly die for no better good

or reason understood? Let us make life better than the neocon envision, and support our rise to popular acclaim by allowing US to speak openly for public challenge in defense of America.

Death to the neocon soldier, death to the enemies of Man.

-
True US Bush Iraq-Afghan Wars Deaths At 21,000
http://www.rense.com/general77/true.htm

"In the last four years of war in Afghanistan and Iraq, the unreported death toll of American military personnel is in excess of 20,000 (20,871)"

It's in cowardice that 'Americans' don't speak out for the lost 'loves' of their dumber than dumb sons.

-

Thinking of vacationing in occupied ungodly neocon aipac israel? Check out the criminal zionist's 'best' selling point...

ISRAEL PEDDLING WHORES TO ATTRACT TOURISTS
http://desertpeace.blogspot.com/2007/06/israel-peddling-flesh-to-attract.html

[The freely self confessed child murderers of the IDF, tell US as demon liars, they're "Jews". Anyone in Israel KNOWS this factually to be so. For, the zionist forbid 'by law', to allow military service from anyone in Israel who disagree that God would will the thieving and murder of the completely innocent in GOD accepting without question. Now why would YOU want that?]

The nazi IDF does what Canada's dope pusher O'Conner suggests we accept. Demon enemy bushite in Afghanistan murder children without real understanding 'by accident', [no evidence is shown to ANYONE, just treasonous demon evil bushite necon spewing, "red handed"] lies after lies, while, the Taliban, we are told, are so much worse, because they would murder "ANYONE." Make sense? No. Remember: (The bush regime has been found funding Al-Qaida in Iran to commit terrorist acts against COWARDLY soldiers without free minds to speak in their own defenses.)

/ / The group is demanding his impeachment not only for his crimes against humanity but for lying to the American people about his worship of Satan. \ \

It almost makes me laugh, and then, I push to remind, we are so very far from where civilized is dreamed to reside. Look, think of US as actors, (because that is who we are,) and support my rise to proclaim by the will of a suffering for real human kind. Believe in US, as if your life depends on

it, because it does my friends, because it does. Live free or die unwillingly.

cause I am just,

King Johnny Wizard
President and CEO

http://english-cyprus.indymedia.org/usermedia/audio/6/christ_in_america.mp3
http://cleveland.indymedia.org/uploads/2007/06/christ_in_america.mp3
http://rochester.indymedia.org/usermedia/audio/6/christ_in_america.mp3

I BEG the Christian men of Earth to help GOD

/ / The currently ongoing "pacification" of Baqubah, a city with 300,000 inhabitants, by some 10,000 U.S. troops is using the same methods as documented in the NGO report with regard to Fallujah \ \

I BEG the Christian men of Earth to help GOD in destroying the lawless bushite nazi thieves, who lie cheat and steal from Humanity for the 'escape' of the ACTUAL zionist 911 perpetrators. Death to the LIAR bushite, death to our enemies, so say Johnny America, Lord and Savior.

Coast to Coast radio hosts MUST face treason charges as enemies to Life as we know it. They lie to the American child, to trick them into sacrificing more lives for the tyranny of the antichrist.

-

/ / Cheney's office has refused to provide his staff with details regarding classified documents or submit to a routine inspection as required by presidential order, \ \

It seems Cheney wants to go it completely alone as an escaping war criminal in America eh?

Demon G. W. Bush "Our responsibility to history is already clear: to answer these attacks waged against us by stealth, deceit and murder and rid the world of evil."

"Deceit" and "murder" to rid our world of justly what dum-uk enemies?

Kill a lawless bushite THIEF for America why don't You Patriot Warriors?

-

Bin Laden may have arranged family's US exit: FBI docs

-

AMERICA HATES BUSHITE

Nationally broadcasted every day across America, Mr. George Norry publicly supports the murder of innocent Arab children, and I'm beginning to really hate a silent dying America for it. Speak to defend the innocent in this world American, or die yourself from self contempt.

Bushites war LIFE itself. So then pleads I again the Son to God, as Man to Men: war to kill the enemy bushite nazi savage thieves, for real Freedom is waged truly by Just causes. The mute, pro-censorship/tyranny THIEVING bushite savaged nation, has NO EXCUSE for the crimes they have committed in our dying names. I demand our voices heard internationally for Justice as Freedom is Godly.

To, with a Love in your Heart for GOD, kill such contempt for Human life, is to serve American freedom to the last bushite neocon breathing. Death to the neocon soldier, death to the enemies of Man.

/ / "They can try to have their votes of no confidence," the president said, "but it's not going to determine - make the determination - who serves in my government."

MY government? Now that's entitlement. And you thought George Bush didn't have a vision for America \ \

Hitler, the mad man, wasn't as insane as our demon enemy George Bush Jr. is.

/ / The [BUSHITE ENEMY] US has said it would refuse any request by Italy to extradite the accused [satanic bushite torturers of completely INNOCENT PEOPLE]. \ \

Christ, The Son of Man, Begs the Godly Men of Earth

Christ, The Son of Man, begs the godly men of Earth, to judicially bill on sight, any neocon soldier who supports the carnage waged in Afghanistan as cop killing dope pushers. They shoot innocent women and children dead in the streets for humor, and bushite pirates at CBC and CNN, state bushite in Afghanistan are doing a good thing helping the bushmob escape the crimes of 911 by warring for Muslim fundamentalism,

persecuting INNOCENT women and Christians, while for entertainment, bomb innocent families running for their lives from a Holy Church. Soulless child killing soldiers who CBC execs would tell are our DEMONIC heroes. Lawless dope pushing cop killers have got to go down dead screaming, instead of the innocent - YOU and me they target for MURDER. Death to the dishonorable bushite THIEVES, death to the enemy neocon LIARS of GOD and man.

We can really be something greater, while a murderous bushite thief, a LIAR, can hardly read or write Liberty without flinching from self contempt.

Kill a bushite LIAR, why don't you my brothers and sisters of the faith in something greater than bushite godless tyranny?

Brig. General David Fraser - former nazi commander of NATO who 'okayed' the bombing of defenseless innocent Afghan women and children for the Satanic enemies of Man, stated on CBC, he liked killing police officers, along with innocent women and children, (deliberately targeted for the pleasures of the demon antichrist) because, Afghanistan's children hope to learn. See? The bushite 'will' murder all our children and teachers on hope that we will never learn the Taliban, led by "Omar the Just", were loyal to Christ as REAL American Freedom, when publicly demanding evidence to form your conclusions. Thus is why the ENEMY to LIFE neocon state on YOUR TV and radio, WE must never be allowed to speak openly with the Taliban regarding the FACTS. Because if we did, neocon pension thievers would be hunted down in the streets for public trial, and then gloriously put to death by Christian values committed to TRUE freedom from lawless godless zionist LIAR tyrannies against Mankind - YOU included.

George Norry and Art Bell are the most evil of bushite, who as betrayers of the Human race, deny soldiers to know: General Ahmad funded Atta. They will both support the murder of Your American Son or Daughter for further zionist evils, before allowing true open line communications, to defend ourselves from the lawless demon enemies of Man. Do something about it, or don't. Let TRUTH set US free.

Instead of making an easy phone call today for your dying brothers and sisters, die as Satanic bad guy enemies of Life on Earth, sacrificed in cowardice to the real demon antichrist, and see if we, the true, strong, and free, care. The Son of Man SCREAMS before coming home to GOD'S America: We are coming to destroy Satanically lawless bushite enemies, all for the love of God, we shall succeed my friends, we shall succeed. I will not willingly live in a forsaken world with LIAR zionist war criminals conning US to believe, God is not Great, True, Strong and Just.

Die bushite die!

-

/ / A manifest showed the goods [BUSHITE HEROIN] were to be
shipped from Kabul to Dubai and then on to Canada. \ \

"We have nothing to do with poppy eradication. We stay away
from [pro bushite heroin to kill YOUR kid with] it as far as
we can," Maj. Steve Graham of the Royal Canadian Dragoons

-

To Kill a Bushite, is to be Heroic

To further murder as these ungodly bushite liars do today as
our suffering Mankind, is to blindly swear public allegiance
to the for real DEMONIC antichrist THIEVES. Bushite enemies
are evil nazi dumfuk scum, liars who cowardly watch America in
her weakness be high jacked, and squeak nothing for Just words
in our REAL defense for dying.

http://japan.indymedia.org/usermedia/audio/12/johnny-rocks.mp3

AMERICA'S Mr. O'Really responding to accusations that FOX NEWS
refuses to cover the war in Iraq on behalf of concerned,
AS DYING, American families, [and forsakes Christ as demon
betrayers to the paying victim audience] Stated:

"Do you care if another bomb went off in Tikrit?
Does it mean anything? NO! It doesn't mean anything."

Why should WE continue to silently die unjustly victimized?,
for the bushite's contempt of Mankind censored?, the Eternal
Son of Man to GOD forever answers correctly.

Kill a bushite as the Love of Justice for Humanity

The Son of Man BEGS all honorable men to defend Life
from bushite enemies of GOD who murder, rape and steal from
innocence through lawlessness as thieves of everyone. Please
kill the bushite for the love of women and children. kill
the bushite for the love of GOD. Please, defend ourselves
further hardships by supporting immediate war crime trials
to begin against all neocon traitors who LIE OPENLY to
kill America's America as enemies to truth, as enemies to
Christ.

Charles Goyette Interviews Scott Horton
http://dissentradio.com/charles/aw061107scotthorton.mp3

/ / Look, do you understand what these [TV politico] people
are saying?

These people, one right after another, are up here talking
about a nuclear strike! [more bushite DEMON mass death and
suffering against Life] On a country that hasn't threatened
US?, hasn't harmed US?, has no capability to attack US? Do
YOU understand the madness we have descended to? \ \

'Kill Anyone Still Alive': American Special Ops
http://www.atlanticfreepress.com/content/view/1784/81/

Can you not as a American Man, destroy bushite brayers to defend
innocent life? Americans could not care less presently for
the value of Human life. Americans do nothing to defend
their lives, but officially plan to murder more for the Satanic
demon antichrist in silence. Out of millions, how many even
bother to make a phone call to talk radio against the neocon.
how many? Five or six? Seriously.. How many? I know bushites
are demon liars for the neocon, but is it really impossible for
"Americans" to try speaking?, in the face of murdering millions
more forsaken by enemy mortal, pro child killer George Norry?
George Norry too nice of a guy to even bother question the value
of American children? The THIEF Art Bell's voice too soothing
to care that neocons own pirated America, and on everything she
stands whoring as WAR CRIMINALS to the FOR REAL antichrist?

Death to the lawless bushite, death to the enemies of Mankind

http://melbourne.indymedia.org/uploads/law_of_the_land_-_we_rule.mp3
http://imctj.espora.org/uploads/2007/01/law_of_the_land_-_we_rule.mp3

http://pr.indymedia.org/uploads/2007/01/law_of_the_land_-_we_rule.mp3

God is Great

Again, George W. bush did 911 with General Ahmad, but CBC
zionists, actual treasonous LIARS, actually smile to dying
Canadian soldiers with only true contempt. CBC kills Canadian
kids, with their intentional demon lies, trying to subvert
Justice for God and Johnny. In fact, yesterday, they did a
special, all on how "God is NOT Great", giving that bush bitch
demon LIAR, all the space to pontificate it's hatred for
Wisdom, Science, and GOD, with only nods and smiles from the
'illiterate' hord. Remember: A zionist KNOWS it's an enemy of
Humanity when it supports dropping seven million land minds to
murder indiscriminately OUR CHILDREN for decades, or stealing
a Christians Home because they say God says Jews would do such
ungodly acts. Blame innocent Jews the holocaust denying
zionist shout, of which not one, is a Jew. Like me.

To Kill a Bushite, is to be Heroic

Pro child killer George Norry, enemy of the American soldier, still blabs about how more must die unjustly for bin Laden with LIES, knowing full well, video of steel flowing like water from the WTC exists, and that General Ahmad funded Atta. George Norry is a traitor to the FBI, who further plans more to die sacrificed under the censorship of the tyrant antichrist. Who cares I ask about America truly dying as neoCONNED, for George Norry has millions to not take your calls for protection, and honestly, 'Americans' couldn't care much less for Our Humanity's future. Live free by defending liberty by killing pro lawless pro torture pro fascist bushite enemies my friend, live free by defending Yourself and GOD.

/ / The U.S. State Department recently issued a report calling Sudan a "strong partner in the war on terror." \ \

The high jacking Bush regime is supporting financially a TYRANNICAL 'government' that openly practices Genocide, as just the sort of "American" partner to assist in determining which further murder victims are terrorists. While the same demon administration confesses to FUNDING middle eastern al-Qeada to commit TERRORIST acts in Iran, as demon evil tyranny against the sleeping Sheeple. Again, it is fully confessed that the Satanic bushmob is pro terror now. Death to the enemies of Freedom, death to the bushite betrayers of Life instead of YOU my innocent friends. Instead of US.

/ / US 'used forced [SLAVE] labour to build Iraq embassy' \ \

Kill a bushite LIAR and be loved by God as Life is True.

DOWN WITH EVIL, UP WITH FREEDOM.

-

Love to God Gives US Strength

The Son of Man begs the Men of Earth to defend Ourselves from the unholy forces of our tyrannical enemies. Death to the ungodly bushite thieving LIARS, death to the ungodly enemies of American children everywhere. GOD praises all Men, who kill the murderous bushite enemies of Just causes. The THIEVING satanic bushite forces, speak only contempt for GOD on our demandings of the public execution of the boastful terrorists, like the bushite who video taped the murderous assault of OUR kidnapped bare footed children, or murdered Iraqis while desecrating ELVIS, done all to please the "escaping" satanic demon antichrist zionist, Our Mr. bush Jr., who with his private business partner, General Ahmad, actually committed the ungodly treasons of 911 in a land of blind men sleeping., according to the eternally Honorable FBI anyway.

Death to the ungodly bushite thieving LIARS, death to the ungodly enemies of American children everywhere. GOD praises all Men, who kill the murderous bushite enemies of America's America. "The Liar" Hannity's America, can go it alone as treasonous liars, who boastcast a con to 'neutralize' America; 'finding' that we believe their demon lies about how one dies sacrificed 'Heroic' without any IMPORTANT questions answered. do we do?

To Kill a Bushite, is to be Heroic

To further murder as these ungodly bushite liars do today as our suffering Mankind, is to blindly swear public allegiance to the for real DEMONIC antichrist THIEVES. Bushite enemies are evil nazi dumfuk scum, liars who cowardly watch America in her weakness be high jacked, and squeak nothing for Just words in our REAL defense for dying. Play pretending their actually real men, because to really be so, requires real strength. Not bush bitch Marines "WHORES YEAH!" strength, where they cowardly can't figure to defend America from ungodly war criminals. War criminals who deliberately set them up with Satanic 'black magic' to be killed in criminal actions. P2OG. But see?, the bushite fodder, can't care enough for Life to read, because it already knows like the zionist, it's an ungodly coward and a thief, as siding to lying and censorship, this will out work for evil doers in the long run without any consequences to themselves as Our sworn eternal enemy.

Bushites 'think' that being Satanic brethrens for the LIAR neoCON, they'll die sacrificed not seen by all Patriot Warriors, as a dead coward - too fearful to stand as a godly Man for true accountability to living Life honorably. Cheney, McCain, and 911's gooliannie believe, You can only TV 'see' them protected Satanically by "Molech" [THEIR DEMON COG] Immune from REAL American Justice the bushite bray, We are told they believe so anyway. By Satanic command, 'inconceivable' to see the bushmob up on high treason charges... Oohh. Yeahhh.. I can see that going for real - quite excitedly I am about saving innocent lives. So, let's get done what needs to be a doing to save ourselves, so we can get this talking all behind us now, and reach for something truly breath taking as awarding,

Your Servant,

King Johnny Wizard
President and CEO

-

Why should WE continue to silently die unjustly victimized?, for the bushite's contempt of Mankind censored?, the Eternal Son of Man to GOD forever answers correctly. We can really be

something greater, while a murderous bushite thief, a LIAR, can hardly read or write Liberty without flinching from self contempt. Bushite tyranny is a dead end road paved with missed opportunity. change your evil ways in other words, and join the living side that's light to know what we are, in deed, looking at here under the dying spoils of bushite, "we pay" misfortune. To hell with Satanic demon devil worship by the President of the United States, We, the People answer, for now anyway, we have some really serious business just presently, and we really don't need to be any more reminded about Mr. Bush's satanic Devil, demon whoreship, of, "Molech", a religion practiced to deceive America into sacrificing our kids for cash with YOUR blood.... Tricked. Tricked. Tricked.

Nationless bushites who blindly war Life as the neocon enemies, war for the 911 perpetrators to escape American Justice. that is why I, as of GOD, cheer to hear the deaths of these pro torture, pro theft, pro Satanic enemies of Man. They confess freely to targeting INNOCENT People for murder.

-

CIA 'disappeared' seven-year-old children
http://pressesc.com/01181202133_39_names_enforced_disappearences

COFER BLACK is the "CIA" LIE, KILL COFER BLACK FOR TORTURING INNOCENT PEOPLE TO DEATH FOR THE ANTICHRIST. Death to the bushite, death to the enemies of Mankind.

-

New admissions of widespread prisoner abuse
http://www.wsws.org/articles/2007/jun2007/tort-j05.shtml

/ / The Bush administration is finalizing new guidelines for Central Intelligence Agency (CIA) interrogation methods that will give broad latitude for torture techniques \ \

These are crimes against Christ, and any 'Christian' who lawlessly participates in this pro-bush torture of US Humans, MUST be hunted down by the Patriot, to have the STANDING LAW in America enforced to institute the Death Sentence to those bushite responsible for such ungodly enemy actions.

Hillary "[DEMON] Bush pulled out the inspectors."
[DEMON] Bush declared, "and he wouldn't let them in."

In Hell

Firstly, the White house doctored the NIE in an act of HIGH TREASON.

Two:

CNN with Hillary acknowledges that the demon Mr. Bush pulled inspectors out of Iraq, but then... how is this not HELL to pay?

/ / Bush declared, "and he wouldn't let them in. And, therefore, after a reasonable request, we decided to remove him from power." \ \ HE LIED. Not the 'NWO', George Walker Bush, who Alex Jones tells US to look away, because he's only a puppet. Should not Bush be held accountable to the criminal actions he is PERSONALLY responsible for Christ asks YOU?

Arkansas GOP head: We need more 'attacks on American soil'
http://rawstory.com/news/2007/Arkansas_GOP_head_We_need_more_0603.html

Look, bushite DO exist as enemies of the Human.

800,000 Christians protected under Saddam, now killed under Bush
http://www.uruknet.de/?p=m33389&hd=&size=1&l=e

Look, bushite DO exist as enemies of the Human.

-

Neocon Soldier

Bushites who war as the neocon enemies, war for the 911 perpetrators to escape American Justice. that is why I, as of GOD, cheer to hear the deaths of these pro torture, pro theft, pro Satanic enemies of Man. They confess freely to targeting INNOCENT People for murder.

The Haditha perpetrators, if convicted, are looking at serving, maybe, a couple of years, for freely confessing to the targeting MURDER, of innocent women, men, and infants.

To, with a Love in your Heart for GOD, kill such contempt for Human life, is to serve American freedom to the last bushite neocon breathing. Death to the neocon soldier, death to the enemies of Man. - The Son of Man, as the Man of Men,

Johnny Wizard

-

CBC and CNN with FOXNews Calls him Al Qaeda, but his Jewish Father calls him Adam Pearlman, a godless enemy zionist, A thieving NAZI liar who hates freedom, who wants to kill INNOCENT Americans for his NEVER ELECTED neocon pro war buddies. Did we mention torture? See? The zionist KNOWS its OUR enemy. An enemy of Humanity, who counts that YOU personally will not phone Coast to Coast radio hosts to allow open line FREE communications. Oh well.. Americans are truly dying evil dum-uks.

-

Enemy LIAR of America, pro-child killer George Norry, "McCain is leading in all the polls."

-

PEOPLE

Who IS running this bushite nazi liar show, where they, our elite corporate media masters, kill our stupid kids with their flagrant naked monster lies, while refusing all calls for clarity, Johnny America really wants to know. Like immediately. Help us out here some man, don't be evil.

Demon bush told us Saddam wouldn't let inspectors in, and that's why he irrationally started this war against God conflict. Impeach him, then have him PUNISHED for high treason against a further dying as truly unheard from America - for that lie alone - we ALL could/should stand together as equals demanding re-dress for the innocent murder victims who've suffered for such contempt, and belligerence for the basic precepts of freedom as Justice, or G-D as Johnny.

People of Earth, know, these bushite soldiers war Creation proudly with repeatedly committing aggravated felons, and South African death squad goons, all to war Love for the neocon god haters. Who, as peenacking atheists, as their very own documents stress, would murder anyone of US for a stolen nickel.

Our Mr. Bush Jnr. "The war is for you or for us [neoCONS] to win. If we [neoCONS] win it, it means your defeat and disgrace forever."

Die bushite die.

King Johnny Wizard
President and CEO

-

Kucinich for President!
http://www.democracynow.org/index.pl?issue=20070524

Now, it's true, America's Alex Jones states Kucinich wants to take away all your guns, and is a communist, but, Alex as sometimes, is terrified of those who seek the requirements to defend freedom directly, as more specific. (Example: NWO isn't the name of the specific guy who financed 911 to murder America.) So, as a consequence, he gets near ridiculous with labels applicable to generalizations only dummies could believe blindly. With Kucinich campaigning on ACCOUNTABILITY, Alex Jones looks quite foolish. But, he's still trying. Thank god for that. Thank god for that. Talk radio in America should take open line calls on our ideas about how to actually plan to defeat these, found factually to be, traitors to God and Country.

MSNBC Poll: Over 400,000 (88%) Say Bush Should Be Impeached
http://prisonplanet.com/articles/may2007/210507_b_Impeached.htm

See? Canadians who TRUST CBC would never know by Paul Hunter.

-

Bush Successful at Permanent Legalization of Torture
http://www.prisonplanet.com/articles/march2006/070306Torture.htm

/ / The truth is that the Bush Administration has used the McCain anti-torture bill to codify a policy of torture that is now embedded in our legal system for perpetuity. \ \

McCain is some kinda demon enemy of God isn't he? To say publicly, he apposes torturing innocent people to death for the practicing Satanic bushite LIAR bad guys, leaves US thinking, shouldn't WE put McCain to death for OFFICIALLY

sanctioning such criminality? I'd easily, without a second thought, put to death all those FOXJunkies in that debate audience who cheered from hell with JOY, the prospect of torturing innocent people to death, 'if it means' such IRRATIONAL action protects "American lives". See? the Magic TV and radio people refuse to allow me or anyone to think through such absent minded ungodly EVIL intent. Example: If you take FOXNews' word for it, and 'knew' your potential victim knows for sure of an impending terror attack... ... .. . How so? See? demon enemy f-cks, the ungodly bushite nazi vermin haters of Justice measured, [who steal in MY America as TRUE EVIL DOERS,] forbid such wisdom communicated as understood, for that would mean, we'd have to allow the real Victims more air time.

And wise poor men such as myself would command respect and gratitude.

and together, WE'D be hunting down those bushite liars who torture innocent people to death for their satanic pleasures. For, you know it does warrant the Death Sentence in America, right? (You can thank Reagan for that...)

-

/ / In a move that hardly indicates that he was a terrorist plotting to attack a US government installation Tatar then went to the Philadelphia police department to complain that he was being pressured by someone into getting a map of Fort Dix and that he thought this had something to do with a terrorist plot. \ \

Didn't see this on our TV news either did You?

-

The King of the Jews is True Red White and Blue

King of the Jews
http://cleveland.indymedia.org/uploads/2007/05/the_king_of_the_jews.mp3
http://chiapas.indymedia.org/local/webcast/uploads/the_king_of_the_jews.mp3
http://melbourne.indymedia.org/uploads/the_king_of_the_jews.mp3

-

/ / On CBS' "Face the Nation," she claimed that intelligence errors before the war were "worldwide" even though the International Atomic Energy Agency's Mohamed ElBaradei publicly stated there was "no evidence" of an Iraqi nuclear program \ \

That from the 911 witch, who forbade a stop to hostilities IN AMERICA'S NAME against the innocent in Lebanon. Nazi Israel ADMITS to the targeting MURDER of any innocent persons who drive in a truck. Perhaps Americans. Who cares? Not CBC or

CNN they'll tell you consistently absent from the crimes scene.

-

Pill popping American GI teens are becoming.. CRACKHEADS!

http://www.zmag.org/ZMag/articles/march02levine.htm

/ / Dexedrine affect the same neurotransmitters as cocaine; and ADHD drugs and cocaine are both classified by the DEA as Schedule II psychostimulants (Schedule II drugs are legal drugs that have the highest potential for abuse and addiction). \ \

American grunts get FREE all the Dexedrine they can shoot

Do you know how a crackhead finds itself? Lost by indifference to the ultimate, only goal, more dope. Freedom Fighter? or crackhead WHORE, who hopes to find a dollar 'somewhere' to stave off it's crackmaster, the "American People", led by the un-elected demon dictator, our criminal Mr. bush Jr., as the true enemies of all Mankind. Bushites are on serious dope to be so dumb as cowardly accomplices to a traitor of themselves, that they would die as, before actually defending God's America - that they gave an Oath to.

I guess a soldier's word doesn't count for much in bushville.

The bushmob did 911 as traitors to God and Country, don't you know anything worth living for? my dying unjustly brothers and sisters? My friends, please fear not wisdom communicated by a REAL Man, for, we explain ourselves to the best of YOUR ability to listen simply. G. W. Bush used no evidence to form America's "conclusion" on who did US wrong on 911. So, Please, stop forsaking yourself, for, we're going nowhere. Support Johnny's call to demand open debate without censorship from the magic radio and TV execs, who hide in darkness, pretending to be our friends, while refusing intelligent dialog to answer any of our big troubles easily. Why? because largely, they're powerless without beating us down as giving 'Christ like' VICTIM so much - with their irrational ignorance for our survivals by the fittest. The fittest Ideas that rule this Universe, are the simplest, most easy to understand, but I digress about GOD'S greatness, for we know,. the corporate media elites as our voice, "Couldn't Care Less".

CBC just did a report about all the great heroin coming in from Afghanistan, that will still cause crime, and be illegal, (and maybe give you life in prison as an American,) but brought in with the help of the demonically evil bushite thieving murderous military, by the likely ton full to attack our direct family left un-protected, BY YOU PERSONALLY. And

guess what? THEY, our media masters, couldn't care less if they actually tried to be our good guys. Reminder: the god guys is good, the demon liar antichrist demon enemies who thieve from Life with censorship is bad. If they hide ourselves too far, they loose all around, up and down. So get to it. Or don't. Your choice. Life lived Now, or damnable death by cowardly design brought forthwith under your own power to do nothing under such terrible costs against our suffering natures.

Typical tyranny for media control over all of Life for the beginners is this treasonous betrayal against our Nature, by refusing to be honest about our potential to be far greater than first considered. If they'd only allow US to have open communications, all our worlds would be better living for it.

Demand Coast to Coast hosts allow America to defend America.

I want air time with the one and only real man in these here parts, Mr. Johnny America, our glorious make believe creator of all we perceive religiously, self realized. He's a genius!

-

No evidence against an accused is US being truly abused

http://melbourne.indymedia.org/uploads/johnny-rocks.mp3
http://alacant.indymedia.org/usermedia/audio/12/johnny-rocks.mp3

Help me gain access to speak freely for open challenge against Hannity, and of America's Coast to Coast Radio network hosts, who deliberately deny you to contend, we're really, one hell of a great bunch of People persons with rights God damn them.

Support Johnny's run for acknowledgment, and get US in the News why don't You. Let me be king for a day my American Kin. Make me a rich, near to dwell, well to do.

Get it done.

-

Like the NAZIS with jews. Zionist Holocaust Deniers that say otherwise, ('Fallujah never happened'), WE should just immediately put to death to save the lives of our remaining loved ones. Death to the murderous bushite LIAR thieves, death to all Satanic bushite traitor enemies of Justice for Man, proclaims I, King Johnny.

Dope Pushing Cop Killers

Support torture as a Zionist AIPAC Politician like demon McCain, and The surviving PEOPLE of the Messiah - will rise up to take you down as the ungodly enemy LIAR McCain clearly IS.

As so is the Satanically practicing (with Molech and
everything) repuglicons straight across the board, who, as a
few demoncrates too, support the CRIMINAL escape of the
bushmob through threats against the innocent LOVED by GOD
ALMIGHTY. A REAL GOD with A REAL SON. McCain has got to go.
Please, I, The Son of Man, the MAN of men, beg and plead again
to all able bodied persons, see the thieving bushite zionist,
kill it to defend Christ, kill it to defend America, kill it
to defend any or all children of LIFE. Kill it with the honor
and courage every REAL PATRIOT has to defend his own family my
friend, lastly, kill it for me. These naked LIAR enemies who
bank to thieve more from Iraq, Afghanistan and America, must
be brought down by Humanity's ultimate triumph over tyranny
through Law. A just law, where those accused without any
evidence are Innocent, and WORTHY yOur defenses. Get to it.

Kill any bushite bomber and be loved by God's America.

Death to the zionist bushite enemy forces

/ / After it was revealed by the Plaid Cymru MP Adam Price
that British trained policemen had tortured prisoners to death
with drills, we discovered, through the New York Times (!!),
that American intelligence officers had been working alongside
them at the Jamiyat police station \ \

Death to the zionist bushite enemy forces, death to the
ungodly enemies of Man who torture innocent people to death
for fun - expecting Johnny's America will not raise a word in
defense for the Human race, or our guns to defend our loyal
brothers to the cause of Justice. Death to the bushite, death
to God's enemies who lie cheat and steal from Humanity to
assist in the escape of those responsible for 911.

BASELESS?

/ / Prime Minister Stephen Harper "We will conclude a formal
agreement so that we never again face these baseless
allegations," he said. Thirty Afghan detainees have claimed
they were beaten, whipped, given electric shocks and denied
food once they were transferred to Afghan security forces by
the Canadian military \ \

These demons who war for ZIONIST censorship are a bunch a dope
pushing cop killers, who murder innocent people they call
'Taliban' better known as in Arabic - students.

-

Proudly kill the bushite who would drop from the sky,SEVEN
MILLION landmines on our cities to kill our children for
decades indiscriminately, while offering our Humanity to God no
apologies. Proudly kill the bushite savages all to
desperately survive ourselves creating a better world through
fair, free market communications. To warring for Liberty as
true Freedom wills, is for Justice understood as measured, not
just made up out of nowhere for the pleasures of those truly
Satanic. So spoke the King of being the wisdom we here
revealed by statement of timeless fact. Good will triumph
over evil. That's that.

-

Tenent "Lets everybody tell the truth."

It seems Tenent wants to inform us he actually meant when
saying "slam dunk" - that, selling the war to the American

Joe, without establishing any real facts would be easier than
anything against the powerless as media unrepresented!

-

/ / Rep. Dennis Kucinich, who has called for a withdrawal of
all U.S. contractors from Iraq. "They charge whatever they
want with impunity. There's no accountability as to how many
people they have, as to what their activities are." \ \

Kucinich for President!

Bushite War LIFE Itself - and - They Couldn't Care Less

'Alpha company patrols the poppy fields.'
20070420_taliban28.mp3 (pbs broadcast)

"About the poppy harvest, currently gathering pace all around
them, they couldn't care less." Instead they kill unarmed
innocent people indiscriminately as enemies to ALL HUMAN LIFE.

They Couldn't Care Less

The 82 Airborne, in assisting in defending the world wide
distribution and production of heroin, tells of murdering
innocent farmers, that would never raise a gun in anger, are
those they openly confess to target for first degree murder as
labeled the, second tier Taliban. That's when not defending
American Pension thiever ENRON'S pipeline managed under their
extremist Muslim fundamentalist regime of intolerance for
public communications, as the continuing thieving of 80
percent the Humanitarian Aid given by Canada to feed the
STARVING, and school our children of the impoverished
Afghanistan, as so reported. Eighty percent. 80. 80 percent
stolen. I'm telling YOU: CBC couldn't care less about what
Canadian soldiers are actually dying as COWARDS for:
"Al-Qaida" = "General Mahmoud Ahmad" = "bush's ungodly
partners in crime" CBC national radio management needs to be
arrested in Canada for high TREASON. Please, be a Patriot,
and demand these zionists allow open communication with the
facts to save the lives of Canadians soldiers they hold in
contempt to die as the bad guys committed to no better good.

Occupation Forces support Afghan Narcotics Trade
http://www.globalresearch.ca/index.php?context=viewArticle&code=20070604&articleId=5514

-

/ / [...] the [New York Times] piece details the torture of [Innocent People] Sunni prisoners at one of the new American-Iraqi "security stations" \ \ Kill the bushite for America, for Justice is Freedom. Lawless mercenaries are not granted by our will to survive truly. A "lawless" enemy granted "immunity" by bushite evil phonies, is that of which, holds ourselves in their confessed contempt for Justice. Receive thanks from everyone, GOD included, by rightly destroying such inexcusable treasonous ungodly enemies of all human life.

Torture is a crime against God and Humanity. So, likewise, joyously, with pride, destroy the neocon traitors of Justice - for the true Love you have as Freedom willed - is as granted. Don't buy their demon lies by blind blanket false assertions, against YOUR Humanity's Innocence in tyrannical bondage, all done in to fool you believing, we have no rights to be heard in our presence - here existing freely. Therefore, to survive US all for something better, halt the 'escaping' murderous bushite thieves for God and America. SOLDIERS: Instead of dying for nothing, my wannabe Patriot Brothers, try joining Liberty's cause, which is our cause truly. Is it because corporate TV zionist money whores, are cowardly and ignorant, as evil hypno muggers, in MY dying for real America, that YOU refuse to speak Now in your Humanity's begging further defense?, on evidence being the only requirement to establish a person's guilt or innocence? for ungodly terrorist activities committed in our name by bushite bombers from the neo-conned AIR FORCE, who, as rotted juveniles, cheeringly bomb us People indiscriminately leaving a Church as something TRULY SATANIC? To dare, in our presence, continue threatening harm against an innocent child of wonder, not yet even born to God's suffering world? Bushites war LIFE itself. So then pleads I again the Son to God, as Man to Men: war to kill the enemy bushite nazi savage thieves, for real Freedom is waged truly by Just causes. The mute, pro-censorship/tyranny THIEVING bushite savaged nation, has NO EXCUSE for the crimes they have committed in our dying names. I demand our voices heard internationally for Justice as Freedom is Godly.

-

Look, these neocon zionists KNOW they are OUR enemies

Israel Knesset member Talab al-Sanai "It took Israel 37 years to develop and perfect these barbaric methods of repression and humiliation," al-Sanai observed. "Surprisingly, the Americans surpassed and outmatched the Israelis in their

[Zionist] savagery in less than two years."

-

Look: innocent people are being tortured to death by those
who hide OPENLY in America's uniform. [let US hunt them down
for GOD, despite what demon lies they argue give them as
Satanic to avoid "The Law".]

-

War and the Police State: Complicity of the American People
http://www.globalresearch.ca/index.php?context=viewArticle&code=THO20070421&articleId=5454

/ / On September 11, 2001, corporate media and the government
elite launched an aggressive political and media campaign upon
and against the American people. \ \

-

SATANIC AMERICA

/ / After playing a tape of Cheney's statement, Russert asked
Daschle, "Did the vice president call you and urge you not to
investigate the events of Sept. 11?" \ \

911 "truthers" don't want to address the hard evidence like
the clear as day video of steel running like water from the
WTC towers, for, as Humanity witnesses, they'd rather watch
silently, children murdered indiscriminately, before,
acknowledging wise godly men from our communities who speak
ONLY facts on America's derision for real, open market Free
communications - freedom fighters who ACTUALLY defend the
innocent from the neocon bushmob traitors. Each day we hear
of near hundreds of US murdered by the godless Satanic
THEIVING "American" forces in Iraq. without near a peep of
concern by "America". Lawless bushite mercenaries torture
rape and murder, paid to do so by the WILLING American tax
payer, and near 300 million "People" (the NAZIS) can't find
the effort to pick up a princely phone and call the ENEMY pro
child killer George Norry, (who broadcasts every day across
America nationally for the IRRATIONAL neocons,) to air any
real concern for our Lives. True, the demon enemy censors OUR
calls, and contrives WE a buyer without questions, but he
doesn't censor You always forever. So, get to it fukhead,

JOHN is growing angry with americans of EVIL ignoramuses escaping the bushmob for crimes against MY HUMANITY. The Son of Man States: Death to the bushite, death to our MURDEROUS enemies, who lie cheat and steal to assist in the further criminal escape of the ungodly bushmob for 911 as TRAITORS.

Loyal bushie McCain as bona-fide nazi savage "Bomb bomb bomb Iran.."

Reporter 'Mr. McCain, you demon liar nazi fu-ker, don't you think your being insensitive to innocent god loving Iranians?'

Pro-Torture of INNOCENT PEOPLE McCain "Insensitive to what? The Iranians? My response is lighten up and get a life."

Johnny America Lyrics: "Can't an American PROUDLY kill TRAITOR pro-torture Zionist McCain for the Love of living Life Justly, as Freedom was Country?"

Investigating the Investigation
http://www.alternet.org/story.html?StoryID=17816

/ / After playing a tape of Cheney's statement, Russert asked Daschle, "Did the vice president call you and urge you not to investigate the events of Sept. 11?" \ \

PRO-TORTURE Gonzales "I quite frankly don't like the idea of the Judiciary deciding who is on my staff." [at Justice]

PRO-TORTURE Gonzales "I did not make decisions about who should or should not be asked to resign." [in mid-term]

As US State Attorneys?, whom have the most serious of American Justice Department Motions of Defense for REAL Freedom?, he's not concerned directly with?, nor would "like" democratic Peoples to be allowed to care either?. IF he gets HIS way he says - as minding for the criminal master. True, Americans are generally, extremely cowardly as Bush's freely giving PAYERS, led for more ungodly sacrifices in fascistic silence, but this continuing charade of incompetence gathering against our entire Humanity, is going way beyond acceptable to everyone concerning. Johnny Wizard conceivers and otherwise non-believers state together:

The Iraq war against Christ has no true justifiable cause.
Torture is against the law warranting immediate death sentences
The Zionist AIR FORCE bomb people indiscriminately as Satanic
The bushmob stole all the Development Funds for Iraq
The bushmob are stealing ALL of Iraq's oil
The bushmob stole 100s of billions from censored AMERICANS, while George W. Bush personally stole 50 billion from America in the first four months of stealing the initial election.

/ / A BUSHITE GRUNT PRISSING PROUD AS OUR ENEMY "I grabbed her little sister and put her in front of me . . as the bullets

began to fly, the blood sprayed from between her eyes, and
then I laughed maniacally." [, then were heard the cheers of
godless bushite dumfuk traitors obscening to God and Man as
the unholy enemy.]

What ever happened to butterfly kisses after evening prayers?

Are you telling me, an American Father, wouldn't gloriously
kill this lawless bushite enemy and his demonic ilk, for our
love of girls everywhere? Or, how about the UNARRESTED
soldiers we witnessed on video beat shoeless children
pratically to death while laughing and cheering? Or like
those that speak zero defenses for Haditha's confessed MASS
MURDERING irrational women and child killers? The REAL demons
CONFESS to going into a house, WITHOUT reasoned approach, and
slaughtering an entire INNOCENT family.. for nothing but
their lifeless SATANIC pleasures. The 'cause'? "The [mass
murdered unarmed innocent neighbor's] back door was open.."
To, for God, gloriously, with love, kill these unarrested
murderous continuing ungodly bushite nazis, is to war the TRUE
enemies of Humanity to save the lives of our precious loved
ones.

Bush Won't Turn Over Emails Until White House 'Reviews' Them
http://www.commondreams.org/archive/2007/04/18/596/

It's like a catch 22..

-

So, the demon liar bush tells US, the terrorists would rather
travel to Iraq to kill Americans indiscriminately, than come
directly to America from wherever instead, to kill anyone who
silently supports the indiscriminate murder of our humanity.

CHRIST HATES the godless bushite nazi THIEVES, who by LYING,
murder our loved INNOCENT family members, all to steal our
good names in God. Death to the bushite, death to our enemies.
See the bushite, you kill it for Christ, you kill it for
America, you kill it to defend Yourself.

The Pentagon's Power to Jail Americans Indefinitely
http://www.jonesreport.com/articles/270307_pentagon_power_jail.html

Look, demon enemies of Christ torture innocent people for fun,
paid for by the silent American tax payer. Americans refuses
to bother making a simple phone call to Coast to Coast to
raise some concern. THEY don't. They refuse to hunt bushite
down in their streets for death to defend the innocent held
indefinitely against GOD'S will. Death to the bushite, death
to Johnny's godless, lawless, fascist enemies of FREEDOM.

/ / Never in modern history has country been forced to pay for
its death, torture, and destruction with its own money - its
own oil revenues. A country where thieves are entrusted with
its richness and where murderous gangs are entrusted with its
security. \ \

Look, CNN, CBC, and FOx News know the bushmob did 911, but
will smile while watching your son or daughter sent out to die
CONNED by their demonic hatred for US freely communicated.
How do I know this? I made the effort of making the phone
calls.

"Al-Qaida" = "General Mahmoud Ahmad"

Defend freedom, and the FBI, by demanding Coast to Coast radio
hosts allow free communications, absent their personal
contempt for preserving freedom to be our America. George
Norry WILL kill Your American child for the contempt he truly
holds for our lives here. He says he only supports murdering
Arab children for the neocon, but when your not looking in his
'shadows', he'll kill your child too, don't doubt it for a
second.

"Al-Qaida" = "General Mahmoud Ahmad"

/ / On May 11, 2006, Kyle Sampson, then Gonzales' chief of
staff, sent an e-mail to deputy White House counsel William
Kelley, asking Kelley to call to discuss "the real problem we
have right now with Carol Lam [...] \ \

-

pleasure of the president

US Attorneys don't serve "the pleasure of the president", they
serve freedom lovers dedicated to defending America from
willful criminality. But, americans are too stupidly weak to
demand Coast to Coast hosts allow open communications on
America's highest of concerns. Bushite america would rather,
in silence, thieve from God as our Humanity, than serve the
protections of Justice as ourselves.

/ / According to the Islamic understanding of power, the
Mujahideen don't compete for the positions in the leadership. \ \

"Those who negotiate in the name of the Taliban will be
killed," he [the bushite nazi dumfuk 'Taliban' 2nd in command]
said. He did not elaborate.

Hmmm. Allah is all, and negotiating for freedom from naked
bushite tyranny is won EASILY through communicating
understanding. The tribal strategy of Afghan fighters, where
Allah is Oonerroh, seems to be not the only thing missing from
the statements of this "Taliban" RELIGIOUS FUNDEMENTALIST top
top top leader. Only "second" to Omar the Just. (Apparently
an individual this current bushite incantation of "Dadullah"
is totally un-familiar of.) Omar, the Just, whom Dadullah
claims he receives his Top Secret nobody can see'im orders.
In other winds: Bill a bushite for God and America, an all

day long you'll have good faith in a world freeing ourselves of godless dumfuk tyranny implemented by the horribly foolish, as deeply ignorant of Allah, bushite demon liars for the traitor neocon. TRAITORS!

"Those who negotiate in the name of the Taliban will be killed," he [the bushite nazi dumfuk 'Taliban' 2nd in command] said. He did not elaborate.

Allah is all, and negotiating for freedom from naked bushite tyranny is won EASILY through communicating understanding. Omar the Just knew this to say so, as do I. And this is why corporate news professionals forbid me to speak openly without nazi censorship, ON OUR AIR-WAVES, because I am honorable, right, and true as believable. While America's fun guy, zionist George Norry, states to support PUBLICLY, the ungodly murder of innocent Arabic children for nothing but his personal contempt of YOUR DYING LIFE, while further wanting to invite thoughtlessly nuking places on Earth all for his secret hatred of US freely commutating. Typical bushite. Ending with to tell US again 'convincingly', that bin Laden did do 911 as a terror-ist bad guy in G's World!!?! How so? EH? How so? he don't care man, he don't care. He and his family have millions of dollars to sell you out, so why care for your struggle to survive in bushville soldiering? Frankly, George Norry is a total dickhead. True, he has lots of money in America, but he's still a dickhead nevertheless.

Alex Jones and me aren't on the best of speaking terms, but I will state, a desire to address every same challenge he has adroitly addressed as publicly lacking. And when I am addressed 'officially', I will campaign to put US in the space to realize, we are the government, we are the people. We don't need to run to the hills and encamp ourselves away to defend ourselves to the max from the man, we are the man. I'm telling yeh, I know this to be so as the sea is we magically. Equal rights for all in God's name is self evident. Self evident to ME anyway... but well.. who am i?, right - I'll tell you as I have for more than a decade as a living fiction forsaken for lack of anybody anywhere understanding in totality what I am here on Earth as true Son to Man - a 'understandable' timeless stand in for G to gain recognition through as honest broker. [I've been everywhere around forever, and.. blahblah.. I know people really don't care to know of ancient wisdoms, truths that guide the order to the Universe, cause often they think I'm beyond their comprehension as a 'better than', when all power is in equal respect for others as our hurting brothers and sisters suffering with tyranny by our collective willful ignorance on Justice.[God's bestest is Just for every reason being thus]] I am one serious genius by no accident in words you have as much

right to contend for yourself being, if you'd only believe we have some good ideas here to really defend ourselves with.

Please my American friend, help US speak out freely Coast to Coast. So we together can start, on demanding Justice for all, as innocence in serious jeopardy. Dadullah is most likely an individual who holds at least some control over official military functions of NATO in the region. So, we're going to seed loyalties of the rare Patriots in the force to recognize our need to isolate who supports, not talking FREELY for peace easily in Afghanistan without question. No evidence was brought against Laden, therefore, the Taliban were True Patriots, and bushite traitors are pure racist nazi filth ridden, toxic, as being cowardly dishonorable as despicably evil, enemies to us all. Put US in Command.

Question the bushite, question to anyone who mumbles disagreement in the godly fact, that WE, as Humanity, will spend the better part of this next generation, hunting every last war profiteering nazi war criminal down for our real Freedom from their, so errorred "endless" tyranny of big money terror. Lawlessness with be outlawed, and ANY corporate american who mumbles otherwise, as an enemy totalitarianist, the clear ungodly, (as should be criminal,) will be put to challenge by their very own children, or parents, or bleeding dead brothers. Hannity must be tried for death as lying that the holocaust never happened from Iran. DEATH to the demon liar nazi fu-ker I say, DEATH to the demon liar nazi fu-ker.

"Al-Qaida" = "General Mahmoud Ahmad" = "bush's ungodly partners in crime"

Who IS running this bushite nazi liar show, where they, our elite corporate media masters, kill our stupid kids with their flagrant naked monster lies, while refusing all calls for clarity, Johnny America really wants to know. Like immediately. Help us out here some man, don't be evil.

/ / "Those who negotiate in the name of the Taliban will be killed," he said. He did not elaborate. \ \ He's either with the proven cowards of JTF2, or the two or three "CIA" guys secretly hunting bin Laden in caves out there with tens of billions of dollars. SPENT EACH YEAR 'unknowingly'. (No reason why, but, they just can't tell You, as the paying for it really while DYING) Put US in Command.

/ / The Mujahideen aren't students of power and don't compete for power like others do. We are students of truth and work for establishing this truth and for this cause we sacrifice our power \ \

-

http://www.godlikeproductions.com/bbs/message.php?messageid=355789

/ / Timothy Griffin, Karl Rove's assistant, the President's pick as US Attorney for the Eastern District of Arkansas. Griffin, according to BBC Television, was the hidden hand behind a scheme to wipe out the voting rights of 70,000 citizens prior to the 2004 election. \ \ Timothy needs to be arrested for high treason, for fixing an election, or instead, what? we'll make him a State US Attorney in bushville?

kill all of them

/ / In his testimony on Wednesday, Pfc. Bradley Mason of Company C said that on May 8, the night before the raid, Colonel Steele told soldiers to ``kill all of them.'' Three other soldiers gave similar testimony. \ \

I would offer rewards for more soldiers to come forward. Why? because there truly is, no honor among thieves. Every bushite soldier in Iraq for the liar neocon is minimum, a purposeless dumfuked cowardly thief. See? if you offer a reward, and they don't take it, their 'fellow' bushite, kill'em for it, right? why take the risk it'll cash in over your worthless life? For, who can trust a lying bushite nazi savage? certainly not a lying bushite nazi savage. In other words: speak against committing war criminal acts of lawless aggression in Iraq for Bush, as CLEARLY un-American, and I'll try to forgive you as human. Or, I guess you'll kill yourselves in mutually muted total contempt for this universal life as actually worth something.

When you see and hear on video, sexually dysfunctional, as sadistically satanic grunt puke pro-bush soldiers moaning, while deliberately killing innocent defenseless Family People running for our dying lives from a holy church, or as just simply anyone standing near the side of the road, then, my friend, you'll begin to understand what evil actually is. And, what needs to be done to seriously save ourselves. Seriously. Justice must be won sooner than later.

Five Star American General Johnny Wizard will train American Soldiers to recognize such demonic behaviors in combat as worthy of immediate frag to defend the lives of truly fellow honorable soldiers. Soldiers ACTually, committed to freedom from godless satanic dumfuk tyranny of the antichrist demon, Mr. evil personified, the UN-ELECTED 911 TERRORIST, George Walker Bush and CO..

/ / "He realized that they had killed these three [innocent] detainees, and in that moment, yes, he decided to help his [ungodly murderously nazi fascist] squad members, [escape Freedom through Law wisely practiced]" Gorecki said. \ \

There is much self evident truth hovering above the realities
of such statements. For the exampled fact, that he did
actually use a weapon against 'his' troops, 'to save them
punishment', says a great deal more than they contend we hear.
Now really, how ''we be dying as godless war criminals for
demon LIAR Bush'' dumb is that? (and how does such an evil
thing steal our military command in an un-defended Johnny's
America? as a dying for bushite tyranny, irrational neocon
war wanker? like holy fu-k..) Remember: evil is real.

The time is now.

Let Johnny Wizard on Coast to Coast everywhere god damn them
man, get US on the PUBLIC radio to make something better of
ourselves by communicating freely. Do it!

Praise Jesus, and pass the ammo forthrightly. I'm a hungry man.

-

US officer "upset" Iraqi suspects taken alive, court hears
http://www.telegraph.co.uk/news/main.jhtml?xml=/news/2007/03/14/wsoldier114.xml

/ / A US military officer sounded "pretty mad and upset" that
a group of soldiers had taken suspected Iraqi insurgents alive
during a raid in which they had been told to kill all military-aged
males, a court was told Tuesday. \ \

Come on now, who wouldn't take great joy in destroying any and
all such ungodly bushite hatred for Humanity in this light of
day, eh? In fact,why don't American Congessmen, who believe
in defending Liberty, campaign JUST that? Why not??? Is it
because they're LIARS?

Like Coast to Coast's fun guy, he ain't taking our screams,
George "pro Arab child Killer" Norry??

Rapists and torturers must not be allowed to rule our pirated
authority through defending the further 'escape' of the
bushmob for 911.

/ / As a result, the Defense Department put up a Web site in
2005 designed to clarify [to the dumfuk bushite demon liars]
that sexual assault is illegal [...] \ \

Rumsfeld, as it was told on Oprah, doesn't want any arrests of
bushite rapists though, so has worked to deny Justice for
female grunts by denying all requests to the 'Pentagon' from
American Police Departments. [and you thought he was fired!]
Why? because, they, the very weakest intellectually of
America's - do what they're told teen kids, ALL don't have
rights anyone in bushite corporate america is willingly strong
enough as a dedicated Leader to speak in demanding defense of,
for innocence.. Why? because they soullessly advocate
continuing bushite war crimes for a stolen dollar. Stuck that

way apparently. Support my rise to speaking publicly for open challenge on the rights and privileges of all concerned parties. Rapists and torturers must not be allowed to rule our pirated authority through defending the further 'escape' of the bushmob for 911. I would like to form a global posse of sleuthers to identify on international open line radio, all guilty INDIVIDUAL parties by evidenced conclusion on our highest of priority issues, and get started with the nothing to hide from anyone global arrests, with PUBLIC court proceedings, done all for our public interest as the refusing to further fall as innocent murder victims.

Let's save some lives, what do you say guys?

Or, are we going to go further with this: George W. Bush: "If the absence of violence is victory, no one will ever win."

YOU

"If the absence of violence is victory, no one will ever win." http://cleveland.indymedia.org/news/2007/03/24652.php

I know, it's seems odd that I am, at the same time, offering answers to any question on the science of God as is pertains to Justice measured, but this is just who I am to be conscious man. So, if we can get over the shock of me being so especially normal, maybe we can then realize, I have some simple good old ideas that transcend through time by rational understanding communicable between any two people. I am not a "miracle worker" to all those I advise to not eat Aspartame because it's a poison that also makes your body crave un-needed carbs, that will likely convert to more unless fat. So, it slowly kills you, while making you fatter than you need be along the dead end journey faithing in "the system". So, why do some do it religiously? Who cares (for now) but to say, our governments are failing US miserably. I spoke personally with one of the head scientists in Canada at "Health Food and Safety", and he told me the scientific analysis done by reputable scientists I found freely available repeatedly on the internet years ago, was completely true. (It breaks down to formaldehyde, and methanol (a slow lethal poison), among other shockers. Poison. P-o-i-s-o-n-s in our food stuffs. Poisons.) However, he could take no action to defend Canadians "officially" because we, Canadians, have our corporate interest news departments completely refusing to defend ourselves from corporate exploitation anywhere, and as natural consequence, we, as the dying world, would together unrepresented, probably lose a law suit from mutant Monsanto through the self inflicted bounds of OUR censored WTO program. - instituted through the top secretly mastered puppet people persons of the 'unseen' NWO I guess.

I'm telling you, we need me as King.

Look: Aegis's workforce, for American PAYING profit, has been publicly disclosed through CNN to be shooting people in Iraq indiscriminately for your money, and when the Pentagon was contacted by Nick Roberts about what would be done, they responded, nothing would be done by Johnny's America but to increase the multi-hundred-million dollar contract with demon enemy Tim Spicer to continue. Now... why you ask? Because the neocon liars, steal money by lying to cowardly American kids about what they mindlessly, without thought, give their souls for. Tim Spicer openly hires South African goons to commit hardships for American GIs to die without end for, in lawless tyranny. Peace sells less money for the neocon war profiteers to murder the innocent American as. (Iraqis, along with the rest of Humanity's Men, WILL eventually learn this truth, or life for you will end.) As an Arab hating bushite, (like what you'd find as a publicly proud practiced hatred for all Humanity, by an Amerkan dumfuk soldier in Google's alt.religion.islam), they say nothing for Freedom by Justice, but root themselves to Spicer's monsters who like killing black guys, as world renown mass murdering racist nazi filth. That's why zionist Israel loves them so much.

Look: Somebody stole four trillion dollars out of the Pentagon.

Look: Greenspan STOLE four trillion American dollars for his international billionaire banker friends before 'leaving'. [Asian market chaos SCAM]

Look: Lotteries everywhere in North America are running the same PROVEN criminal scams that cost US ALL billions and billions of public dollars that, without question, (as MATHEMATICAL FACT), regressively destroy our dying communities. CRIMINAL. [Solution: 100 percent cash payouts.]

Look: corporate magic TV people couldn't care less for US if they tried. Ahmad funded Atta. bin Laden claimed he played no part in 911. And video of iron running like water moments before the first tower fell is freely available for download all over the place. CBC, CNN, FOXnews et al. know the Bushmob did 911 in other words. I've spoken to most of those 'in control', and I'm telling you, they're losers, and they know it. Remember: they'll censor my voice to send YOUR child to die for no better good, or reason understood, while entertaining. Weekend TV in North America totally sucks. Now, why do YOU think that is brother? The more powerless they make US, the more money the neocon zionists can murder Humanity for, thinking they might just get away from this if we continue to take no action in defense of anyone as God would will. Let me be Your servant King, by backing me up some here. We need some dollars to eat, and I need it now before we starve to deaths.

Look: Barbra Bodine did the Cole bombing. [the Cole whose crew has been completely overhauled. Where are the many who served there NOW eh?]

Look: America has kidnapped countless thousands without evidence to be held against OUR will indefinitely. [Like the NOT Jewish Israel]

Look: innocent people are being tortured to death by those who hide OPENLY in America's uniform. [let US hunt them down for GOD, despite what demon lies they argue give them as Satanic to avoid "The Law".]

Look: the bushmob war profiteers STOLE the Iraqi Development fund

Look: the more than 100,000 security contractors for Bush are officially deemed lawlessly unaccountable to anyone - THINK ABOUT IT

Look: Negroponte PERSONALLY stole the Iraqi emergency water provision money

Look: Sattler OPENLY committed the worst war crimes of all Humanity's history

Look: I am a guy that is regularly denied public access to our national radio programs because I speak documented truths consistently on behalf of real honorable soldiers and police officers. I agree with most, if not all facts Alex Jones importantly brings to our attention, however, I almost as often, disagree with his conclusions.

Support my cause, which is your cause.

King Johnny Wizard
President and CEO

-

Senior Military analyst, Rob Riggle "In the field John, the soldiers are out there, every day, risking their lives, for a common Ideal: that none of the President's decisions be questioned."

This is more true than a bushite would admit before murdering a honorable father to rape his young child, like Lcpl Boudreaux freely confesses. Boudreaux will tell you, openly, you have to murder the Arab father of the Arab child your planning to rape, because if you don't, that Father will spend the rest of this life, hunting you down in the streets to rip you limb from limb for it.

Let US, me and the few, proud, and the brave, bring that Father's intent to bare on lancing Boudreaux, and any other who would sing in it's ungodly defense.

Zionist american media celebs do tell, everyday, soldiers for the neocon are all Heroes. (True Hero worship has long gone

dead, and simple common respect for the starving man of Johnny Wizard is almost entirely illusionary, but for the love of God has for me, the Son, to never stop caring religiously.) While McCainites advocate imprisoning any (chosen) man in America (with our familiar "Exploitation Units"), who has a picture anywhere on their computer of a fully clothed teen, while denying this following censored video of children being beat to death for fun and profit is real. When I watch only thirty seconds, my rage as a god increases beyond anything anyone of Humanity can even contemplate, and i start crushing bricks in my hands with fury, twist iron bars into pretzels, all as a foolishly feeble attempt to personally have killed those present in this video. Then I cry. I cried for these children present in this video the first time I watched it, and I cried last night briefly, before stopping it.

Please, my brothers, join me in hunting each and every bushite present in this video down for death. For a Love of God that will never end, until we have seen each and every responsible child killing bushite present brought to true Justice extreme.

/ / British Soldiers beat unarmed Children
watch?v=l2zZkbhc77M>
.
Even after they plead them to stop they continue and
the cameraman seems to be having an orgasm.

news_of_the_world_uk_iraqi_beating_video.wmv \ \

Did you know Blair had arrested the reporters who reported this initially? Didn't think of defending children, no sir. For, the commentator, who gives the play by play, while masturbating, has been given forgivence because it's an heroic "Christian". Not publicly executed. This must change for the better. Here is where I will make my final stand, and where heaven shall part from hell in America.

9/11 WTC Molten Metal
http://www.youtube.com/watch?v=VW-HE6rGDHI

-

Men pick military as sentence
http://www.centredaily.com/118/story/29432.html

Great, more criminal heros to victimize Humanity for.

-

ARE YOU TALKING TO ME?

George W. Bush:

"If the absence of violence is victory, no one will ever win."

But for those of us who would believe protection to be a heavenly good thing actually he means? What the. does he mean?? Find out!, in the new candid, let's talk politics interview, with no other than, PRESIDENT GEORGE W. BUSH. (talk about having connections!) Have your mind blown on his TRUE wisdom, seldom since ever, so wisely articulated in a more private setting, than this: The Story of the Millennium.

ARE YOU TALKING TO ME? - A Johnny America Exclusive! - a candid interview on Bush's deeper than ever political thoughts about the war, up front, and personal. Surely, an historical event such as this, with the revelations contained in his own shockingly powerful words, while granting a stage in Johnny Wizard's World, is frankly, beyond the pale, quite shocking in perspective I'm sure I would state again. I feel confident Bush's surprising candor on life's humbling higher meaning wont make the crazies 'out there' any more less right per say. As for the barely living of you passing travelers to our dying Realm.... be ready to be taken on a journey of such profound discovery, with a wit never before witnessed from President Bush!, all about the cruel hardships Americans continue to endure without guidance through effective leadership. Without evidence to form his guilty verdicts. That orders the murder of the innocent with. I kid you NOT. Hey? maybe the Son of Man doesn't have to wipe out the entire human race after all.. With Bush co-operating now, I personally believe, no, I know, we're going to make a go of this after all.

Let US speak in challenge to any or all bushite enemies

NATO war plane bombers must be hunted down by the will of Humanity to be gloriously publicly executed to defend the innocent lives, they once again, have indiscriminately murdered in Afghanistan without a sliver of evidence, but for to say, some dumfuk had a 'rumor' that a single individual SUSPECTED to be an anti-heroin pro-child defending Taliban supporter, granted the bombers of NATO to wipe out an entire village MURDERED indiscriminately by the TRUE demonic enemies of LIFE. Please, if you must forsake me in your personal cowardice and self loathing, don't forsake GOD and America by not killing with PRIDE, these bushite dumfuks of NATO the first chances you get. Love liberty as if it were your own, and kill a lawlessly murderous bushite nazi savage for your

love of anyone included. (You can quote me forever on that.)

Giuliani told ABC's Peter Jennings on September 11, 2001

'..and I was operating in there [75 Barkley St.], when I was told that the World Trade Center Towers were going to collapse.'

WTC TOWERS? "WERE"?

Did you know that the international Johnny Wizard comic book is out there? Don't miss out on picking up a copy for yourself, or your loved ones. And did you know, I'm trying to get on international radio without a censor to thunder my audience back into submission. I HATE HANNITY. All I want is free open debate to resolve this crisis, that doesn't have to be so ruining our dying worlds without questions forwarded by the dumfuks. Justice is Paramount through reason to be so. The Bush Administration have been up to no good, escaping for 911, that New York City should sue for. Hire me on as legal consultant buddies, cause I'm like near starving broke here, with supreme court challenges failing my cost factor, and hunger pangs slowing our progress on fighting unjust incarceration. I desperately need money, like now, as a gift, or an advance on a industry paid private consultant gig. Or, instead, maybe you'll idly watch some innocent person willfully be sent to prison by liars in your demonized name, to defend the ungodly evils of war criminal traitor, our Mr. Bush Jr. in foolish disguises. Your call Bud.

be Wiser,

Johnny Wizard - Patriot Liberator of Eternal Destiny
(i.e. REAL sustainability as self sufficiency)

(i.e. nothing is separate from existence ourselves, not even time, and Justice is binding to defend our lives if practiced fairly with it's elemental divisions through reason. Example: a person accused of a criminal offence, without any evidence, is INNOCENT. Those who say otherwise, are the actual terror-ists. Civilization's ancient Founder Hammurabi, suggested just to openly publicly have executed those who lay capital allegations without any evidence, while working to close outstanding criminal investigations. A made CRIME within ourselves Hammurabi claimed, and by thinking such ways, brought birth of 'Civilized' to an untamed till then, chaotic confusion. Old becomes again anew, because Americans are weak as polluted, and too cowardly to defend the rights of US innocent. Let's change that. Support my climb to international controversy, with my unchallenged claims of direct accountability being sought, for the 911's neocon war terror plot.

'A military judge ruled last week that Watada cannot base his defense on the war's legality.'

Telling US what?, that it is a crime to not commit a crime? It isn't only high treason against America the ungodly bushite are guilty of, but of a madness held by those truly Satanic..

/ / 'Why are you taking pictures? You don't have permission."' [...] the [bush whore] American, speaking through a translator, warned him that he did not want to see any AP photos published anywhere.\ \

No bushite was found gloriously killed for country, yet, they, the godless bushite enemy, continued to shoot innocent People indiscriminately for a distance of six miles, while likely, secretly masturbating each other as bushite liars do always.

The pro-bush irrational military said only eight innocent un-armed Afghans were counted as murdered deliberately, by those who believe our Mankind, can not ever find themselves accountable, without zionist controlled, corporate news permission. See? The military counts mankind as zionist, but I am a man of real men, committed to defend our world from all enemies, foreign, or domestic. Unlike a bushite traitor to God and America, who's word, as Oath, means as much to them, as we do. Ungodly as they are loveless, the bushite, is Life's enemy.

See my friends, this is why I, as the Son of Man beg and plead for all able bodied men, to kill treasonous bushite on sight, for every time you love God by defending the innocent from murder, (the innocent whom any pro-bush corporate professional hold in total self contempt,) you save REAL peoples lives, and you defend God's good name to love God as ourselves committed to true Liberty. Bushites are enemies of freedom, enemies of God, and worthy of death, before allowed to further bomb people indiscriminately like the commanders of NATO order day after day without risking instant frag because, bushites are blind cowardly thieving nazi fascist savages, brain damaged, who believe as satanic demon whores of Molech, they can con all of US including me forever, just like dare dubya. Dumfuks.

God is Great!

-

WHERE IS YOUR NATIONAL NEWS TO DEFEND OUR PRIVATE INTERESTS?

Former FBI Director Calls For New OKC Bombing Investigation

/ / The FBI man in charge of collecting evidence from the government building destroyed by the Oklahoma bomb has called for the case to be reopened. \ \

WHERE IS YOUR NATIONAL NEWS TO DEFEND OUR PRIVATE INTERESTS?

First things first: America must demand the immediate arrest of those who told America the victim committed suicide, when clearly, due to autopsy photos, the individual was tortured to death as the innocent. So, the 'officers' responsible for the fraudulent claims, need to be arrested for accessories to MURDER. The torture will earn them both the death sentence, if found guilty under STANDING AMERICAN LAW. And any bushite like a, it's always a great day George Norry, who purposefully with criminal intent stands in life's continuing way for Justice's demand, American Patriots will phone to Bill with every once of pinky power we have at our disposal.

Support Johnny Wizard's personal challenge against thieving LIAR traitor Hannity, and his corporate nazi bush whores who lore our stolen values by how much they can deny US privilege. Coast to Coast radio hosts need to be publicly challenged for debate they deny US knowing of together naturally speaking. Great example of our Problem: CBC National Radio, in Canada. When a caller phones during the very rare moments we're taking public words, have a pre-broadcast rig-a-ma-role question session, you'll have with not only the OFF-AIR screener, where he'll probe you for controversy, but after the first process of noting in book form your disclosed intel, will notify you that; IF your independent thought is granted by the "Producer" (- who reviews everyone - rules are rules -) Our national station will phone you back this afternoon, so stay tooned, to line you up with your baking gingerbread creds. They never ever dido! The more Brilliant you are, (like the highly charged as extremely charismatically charming, wild man ruler, Johnny America - the media phenomenoner) the higher probability they'll find POSSIBLE concern, on their do nothing for your taxed attitudes..!. Why take chances someone might show a greater living responsibility to a real suffering God as our left corporately forsaken Country?.?.?. A dying Humanity.

Look, seriously, my friends, we have all the answers to our problems.

Support Johnny Wizard's personal challenge against thieving LIAR traitor Hannity, and his corporate nazi bush whores who lore our stolen values by how much they can deny US privilege of equal standing.

Get it done brother.

-

/ / Corporate TV News people are part of a death cult that doesn't rely US on evidence for proof they say we believe them unbiasedly without question. While forbidding ourselves to hear OUR calls for real Justice. \ \

-

Help me gain access to speak freely for open challenge against Hannity, and of America's Coast to Coast Radio network hosts, who deliberately deny you to contend, we're really, one hell of a great bunch of People persons with rights God damn them.

Let's do this.

-

Use this address in Firefox to get daily News podcast of Alex Jones.

/ / If you don't have an instinct, to stand up for women and children, your not a man. That's what men are supposed to do, it's not anything *special*. I'm nothing special. \ \

-

/ / KBR's Tiger Team stayed at the five-star Kuwait Kempinski Hotel, where its members ran up a bill of more than $1 million. This outraged the army, whose troops were sleeping in tents at a cost of $1.39 a day. The army asked the Tiger Team to move into tents. It refused. \ \

See? KBR is now privately running hospital care for the dumfuk grunts, so, what would you expect but rat infestations? Oh, you never truly thought... what being a "Liberal" or "Conservative" victim is. Are you pro Liberty, or pro tyranny is the question riddled really.

-

"For every fatal shooting, there were roughly three non-fatal shootings. And, folks, this is unacceptable in America. It's just unacceptable. And we're going to do something about it."

- President George W. Bush

Kill a bushite and God will love you for defending US, the innocent in war time.

GOD PLEADS: KILL the lawlessly thieving demonic bushite ENEMY of Life.

http://mediamatters.org/items/200702260008

/ / Wash. Post parroted White House claim that Iraq war was authorized by U.N. Security Council \ \

Seriously, the propagandists responsible, need to REALLY, be put to death after found out through US public court proceeding. NO ONE would disagree that Iraq is a war crime, where more than a MILLION INNOCENT PEOPLE have been raped, tortured, or murdered by dumfuk bushite grunts. If YOU actually think about it, all of everyone would gladly kill an unholy bushite terrorist, before allowing it to murder

families running for our lives as loving Church goers.

-

/ / · Clandestine operations against Iran and Syria, as well as the Hizbullah movement in Lebanon - even to the extent of bolstering Sunni extremist groups that are sympathetic to al-Qaida \ \

Look dummies, by Bush funding bin Laden forces, he is undermining the troops to DIE. Lawless American can not be allowed to accept this from the actual demon anti-Christ, can it?

-

Death to our Enemies

My friends, People are dying because the, Israel=Jew, magic radio and TV crews, wont broadcast THE TRUTHS of our publicly available findings. Police findings. People are dying needlessly, illegally, irrationally like meaning really stupidly on Bush's behalf, for they claim, we don't want to be 'embarrassing ourselves' with MY wisdom, You people seem to not be there for God when the chips are way down, and truth is plain to see.. 911 was an inside job, and CBC with CNN don't want to tell us about it, but will watch our LOVED children lied to, to go out and die further for a causeless war of criminality unparalleled in it's wickedness.

/ / Leaks in underground storage tanks can contaminate water
supplies used by nearly half of all Americans, and the GAO
reports there are some 117,000 known leaks across the nation. \ \

-

Don't let these neocon zionist bastards do this to US.

Bushwhore Tony Snow "[...]We know[...]"

General Pace "[..]WE DON'T HAVE PROOF[...]"

Senator Hagel "..we're decimating our National Guard."

Again, commander Blount, a Saudi, from the third infantry,
gave out 170 TONS of plastic explosives from Qaqaa to kill
Marines with. And, "American Patriots" don't rightly bill the
true demon nazi fuker for it. Again, Blount, a Saudi,
confesses to ordering SOULLESS bushite soldiers to murder
People indiscriminately for profit, all so to let US know he
is there still laughing with our stolen billions. Bill the
bushite Bush bitch Blount, a Satanic demon ENEMY for it.. why
don't you? as the snookered to sacrifice your loved Family
Guy, American Dad? Corporate TV News people are part of a
death cult that doesn't rely US on evidence for proof they say
we believe them unbiasedly without question. While forbidding
ourselves to hear OUR calls for real Justice.

Get it done.

http://www.crooksandliars.com/Media/Download/14453/1/Greenwald-Colmes-Gaffney1.mp3
http://www.crooksandliars.com/Media/Download/14453/1/Greenwald-Colmes-Gaffney2.mp3
http://www.crooksandliars.com/Media/Download/14453/1/Greenwald-Colmes-Gaffney3.mp3

promoted through the tyranny of censorship

Corporate News America's Terror Expert, Gaffney, who publicly advocates the rape and murder of the innocent in Iraq to thieve from for the 'escaping' neocons, (as the truly UNGODLY,) stated these words about why American Soldiers continue to lawlessly DIE sacrificed for no better good or reason understood, as total willing dumfuks under deep hypnosis:

"It is not George Bush, it is not the Neocons"

"," = swinging pocket watch

Don't let these neocon zionist bastards doe this to US. Either Gaffney suffers from some blind dolt syndrome, where he clearly can't see himself flailing madly in criminal ignorance, or he's an accomplis of blatant treachery, to help escape his demonic war profiteering benefactors who murdered thousands of Americans for similar gains through the unspeakable bonanza of the "Pearle Harbor" like event that 911 was. What the peenackers publicly stressed they would crave to fool US into Iraq and beyond as glorified war criminals. 911, New York City, where thousands of Americans were murdered, and millions polluted. killed like now American teen soldiers with the Iraqis. Led by a Sattler, or Mattis, Blount or Russell, who order the murder of women and children openly, and 'they', the actual soulless minions of the demon antichrist, the true dumfuk cowardly enemies of Humanity, don't cut them down instantly instead for Life as cherished. That must change for our betterments. Kill any bushite bomber and be loved by God's America.

Any Commander that doesn't support the arrest of those responsible for 911 and the subseqent neocon war crimes of Iraq, is a traitor to God and Country.

How much much God take as taken, before you people get on over this criminally empowered war monger Congress of an unelected lawless dictator demon, and call them out on the turning talk commercial radios, all to finally truly defend ourselves with a good media plan for results.

Make the call, be a man.

-

Sir Ken, head of the Crown Prosecution Service

"The fight against terrorism on the streets of [..] is not a war. It is the prevention of crime, the enforcement of our laws and the winning of justice for those damaged by their infringement."

You got that right. So, join US in demanding the quick trials, and public executions of known bushite enemies who murdered Americans on 911 with general Ahmad, and who with Peter Powers, murdered the innocent in Britain for more stolen goods against God. And anyone in the air force as bushite bombers should be a great joy for US all to hunt for prosecuting too. The bushite dumfuk is an enemy to our lives, with it's blatant naked contempt for the innocent, who like the demon liar THEIVES at CJOB, George Norry, or Hannity, will forbid ANY human defenses of the lawless dictate of the IRRATIONAL tyrannical demon antichrist, all so to victimize more of You as the censored forsaken.

REPENT. [from the Greek, meaning to think.]

The TRUE Son of Man Johnny Wizard Exists Born to this Eternal World to end permanently demonic bushite enemies of Creation. Help Life out by destroying cowardly America's greatest threat to the Species, the greatest threat against Humanity's Freedom to be Loved by God. Corporate nazi zionist bushlores at CBC, CNN, and criminal thieving from the desperately poor in Winnipeg CJOBers forbid open communications, and I can't 'take over', because then I'd be defeating my own, power to the Peoples argument. So, it really is up to YOU, yes you there... reader. Who.. really..? YOU, here, now. Life begs, takes a stand for your fellow man, and demand our voices heard for the defense of the entire human race. And be quick about it. Repuglicons don't want freedom from endless war where they kill your forsaken kids, for we all know, bushites would be publicly tried, then spend the rest of their treasonous lives behind bars broke, or dead from lethal injections made popular in America. Again, officer Bowman is responsible for letting 'escape' those from Fort Detrick, who attempted to murder the American Congressmen who thought going into lawless tyranny, !makes no sense! Where is corporate America on our issues when OUR free speech is ruled by the irrational evil minds of Limbaugh, Bell, and Norry?!?!! Back to Bowman: Bowman, also is responsible for sabotaging the Moussaoui warrant. And, how much you wanna bet, he's probably the same bushite who found Atta's passport, and likely had all 19 names of the high-jackers to give CNN, CBC, and FoxNews just like the neocon's "bin Laden" would have too. Take the publicly prancing bushite enemy out for questions by yourself, if he doesn't plead his defense publicly on Coast to Coast by tomorrow. Remember, there ain't an "Intelligence" group worth their salt on the face of our Earth, that doesn't know exactly what I'm doing here honorably for a real Justice made through careful thought. So, support Johnny Wizard speaking for public challenges internationally, and with the 23 plus co-operating for life 'Intel' agencies, along with, anyone else who can join in on the call. as a growing number of Patriot Soldiers, who trust yourself to see, this wanting of

Justice isn't complicated. A person accused of a terrorist event without any evidence, has our accuser a bushite, who should be watched carefully until verifiable conclusions are done by the understanding of fact. Not faith. With George W. Bush making real decisions in faith, expecting us to believe as corporately broadcasted unabashedly unbiased, that he is not a deliberate incompetent monster war criminal of unfathomable evil?, who is just too 'stupid' to understand why we are innocent until proven otherwise?, is really something we all need to scream about to save our dying lives.

"[..] just like the neocon's "bin Laden" would have too."

However, the real Laden, on video taped confession, claimed he played no part whatsoever in 911, then later, offered himself for arrest, confident he would be acquitted. Not corporately newsworthy though, so, few even know why their American child was later died in the terrorists act of corporate contempt for US living Freedom with something greater as real Justice wills

Yours again,

King Johnny Wizard

-

CONTACT

/ / IDEA: Let's get our show up and running, by allowing open public investigations To be conducted internationally, with open line challenges, so we can publicly isolate each and every bushmobster personally responsible for 911, and then, all of everything else still left outstanding murdering ourselves. Whatdoyahsay?? \ \

Art Bell, the zionist enemy of Life, wont allow free communications with the established facts though,

What do you think? Are you truly all alone on this?

Again, more than half of the money being spent on demon Bush's wars against life's reason for being, is completely left un-accounted for thieving. Not spent to offer dumfuk cowardly soldiers help hunt to kill bushite rapists and torturers. Stolen American values Just like the bushite soldier on the ground, who after gunning down innocent people in the street, go through our pockets to steal the spared change. Kill a bushite for the love of God why don't you my American Patriot brother and sisters?, today!

Again, my friends, Art Bell and George Norry have thousands of bushite dumfuk in America that will phone them to tell US how greatly they are to have no care for dying freedoms in America. While when the humans call, Art Bell for example,

between breaks, when privately screening his calls, just hangs up on anyone he fears might articulate things like Ahmad funded 911's Atta, according to the FBI, in defense of America. I say, we at LEAST, talk about putting them both to death for treasons against Your Life dying teen soldier, wannabe Patriot. Make sense?

Again, corporate nazi america states 30 percent of America supports the ungodly George W. Bush's demon antichrist action, when in truth, it's less than one in a thousand. it's just CBC, CNN, CJOB, and Art Bell the liars ain't taking our calls for enlightenment. just like they treat the innocent in Palestine for zionism's encouraged racist in-action. For what does a fan of 'we're the best' Coast to Coast radio network family know about nothing after we witness them froth at the thoughts of nuking countries, or calling for enemies, none of us here in North America have any real problems with?

People of Earth, know, these bushite soldiers war Creation proudly with repeatedly committing aggravated felons, and South African death squad goons, all to war Love for the neocon god haters. Who, as peenacking atheists, as their very own documents stress, would murder anyone of US for a stolen nickel.

Unhinged and unfit for office

/ / commanders may give orders to ``shoot first and ask
questions later.'' \ \

This is why the Son of Man through God begs the Peoples of
Humanity to kill on sight, the enemy bushite betrayers to
Life. Ourselves, the innocent. These soulless grunts don't
destroy such deserving commanders, Like Blount, Sattler,
Russell, Wuterich, Pantano or even Kimmitt, and instead, as in
Fallujah, murder every woman and child present, while stealing
all our given monies for desperate life saving help. Anyone
in the Air Force deserves to be justly put down, for, I've
NEVER seen any legitimate bombing campaign, but for to kill
People indiscriminately like NATO regularly does with
radio-active toxic waste, while then sending in the dumfuk
Marines, or the 'from the coast' Canadians, who of course,
rightly get killed on the ground in retaliation for such blind

evil stupidity. Please, I beg, help Iraqis, and kill the bushite thieves to defend our forsaken God. American children, help me my loves. Please don't allow the bushmob to escape for the treasons against America on 911, for, bushites are OPENLY traitors, as the TRUE enemies of evidenced Justice, as the Freedom to do our own things loving God on our own. Besides, most bushites aren't even registered American citizens. Bushites need to be hunted down for destruction - by the Loyal Christian American Patriot Soldier, the ones who war to win against those who torture US innocent to death as the ungodly Satanic LIAR enemies. Save the Humans, kill a bushite false accusing traitor of American Freedom To-day, and become a real Man in the presence of Johnny America, an actual Man of Men, Lord of Lords, and King of Kings.

McCain is insane
http://www.codemonkeyramblings.com/2007/02/they_say_that_insanity_is.php

Alert the USER! not tyrannical leaderless dumfuk thievers, for it is the expresser who, if any, that is guilty of a determined illegal expression. In 'The' Canadian case, they, (once proud IRRATIONAL bushiter THEIVES [pro Afghan child killers determined to help the ungodly demon Bush's 'escape' for 911]), want/HAVE to put MEN is prison for beautiful pictures of girls in panties, or bubble bathtubs being. IT IS demonization. Leaving twenty year olds to look like they could be tens in a singled out of context womanly derriere, that our Jurys nations-wide, are generally, denied to perceive normally, if at all. McCain knows he is an enemy to God's children everywhere. McCain speaks NOTHING to demand the execution of hiding as 'British' soldiers who on prized video tape, beat to death young barefoot children for erotic fun, nor on mercury vaccines not banned minus "The President" in name. BANNED.

Sorry everybody, but that's the way it's gotta be for my Life to have meaning terms.] Long story short: Females Rule, and wiseguy Johnny is Freedom King for this moment Being.

Please help God.

We have to overhaul how all our national news Podcasts are assimilated through corporate nazi zionist censorship. Art Bell and George Norry are enemies to ALL american teen troops put in harms way to die as bad guy irrationally for the neocon God betrayers. Why? because they purposefully lie to have YOU die as innocent murder victim. Death to the bushite, death to God's enemies.

Be a friend if not an enemy,
Your buddy,

King Johnny

-

How is a Zionist Jewish?, I, the King of the Jews Messiah ask my fellow brothers and sisters everywhere. How? FOUR million land mines in Lebanon a godly act is it? Jew only roads not Aparthied, nor stealing a Christian's Home I suppose..? How?

An Oath Every Soldier Swears To God With

/ / she told The Nation. "If I contribute to the Army's prosecution of Lieutenant Watada on speech-related charges, I will have colluded in suppression of speech. What could be more hostile to the ideas of a free press than that?" \ \

Again a Patriot Soldier whose only crime is that he refuses to commit a crime in Your name. Do something about it. You defend this Patriot American Citizen as if Your America depends upon it. The "Judge" who publicly forbids to hear Watada's freedom defense, an Oath every Soldier swears to God with, is a "Judge" who needs to be privately arrested for treason against YOURSELF. Support my call to demand our voices heard for Just causes, or go die silently to the grave prisonized in a military dictatorship your 'neighbor' will say quietly of, (under his bushite breath,) good riddance to caring where my pusher's overdue payment goes to??. who the kcuf are you?? ... Eiiiaaahh! Jesus kills bushite for breakfast.

- On yet another, praise be with US, Alex Jones News Podcast -

Bob Watada: "He did his own research, and he found that there was not only deception, but clearly lying by the commander. Now if YOUR boss lied to you, and put YOU out on the line, so that you can get KILLED, what would you do?"

The Fight for Survival slog match between, Johnny 'just tying his shoes' America, and Warmonger Liar, Sean Hannity - televised World-Wide!!! With Cheerleaders, beer, pizza, and beer! YEAH WAY!!!

Who's with Me?

-

A Public Letter to the "American" Coast to Coast Radio Network:

1. We, as the People, demand you allow US, the human species to openly discuss the public evidence on who funded the terrorist acts of 911 according to the FBI. And full disclosure on the science of building Seven.

2. That the Iraq war never had, nor ever will have a justification, concluding Naturally, that all stolen Iraqi

money must be returned by the will of GOD to the victims; with those responsible for stealing it, made to pay US back, with the true American Patriots to be found, backing US up 100 percent. The bush administration has teamed our kids to mercenary forces who have no loyalty to freedom but to freely die another Marine for more dying stolen values. While successful at it corporate America, just lies and lies and lies without shame, nor apology for the death of your poor cowardly kin.

3. Also, that mercury tainted vaccines are deadly stupid. Mercury is scientifically understood, without question, (no doubt) to be a neural-toxin, and, Influenza is a constantly mutating virus. So, pre-determining which 'deadly' strain is going next, is only because the WHO wants to continue killing US for huge cash profit. With cult slaves, like those who forced Jones Towners to drink at gun point, are the same as those who now demand we give our girls of America from Texas such. It seems the magic TV news people don't want to trouble us on this matter of our actual survival.

You must wake up to life's demand for you to defend our dying lives my friend. Please? Make the call, be a man to defend our women. Be a man to protect our children.

Support our call to be heard my brother.

That's all.

Iran prepares first nuke strike
http://www.menewsline.com/stories/2007/january/01_15_2.html

See?, demons exist!

More settlers videos: "We killed Jesus, we are proud of it!"
http://www.uruknet.de/?p=m30420&hd=&size=1&l=e

Remind the Son of Man to hunt them down for better good as we together are, why don't You see? I'm Your brother!

-

/ / State Department spokesman on 24 January, "that Iranian agents are involved in these networks and that they are working with individuals and groups in Iraq and are being sent there by the Iranian government." \ \

We all know Iran has been trying to help Iraqis openly, so then, what does such willful contempt for your life grant this 'spokesman'? Or, how about when Bush stated Iranians in Iraq deserved to be murdered? (Later, the demon re-worded himself in attempt to conceal HIS true evil identity.)

Remember the Bathists actually warred to kill and won against
al-CIA-duh forces that were caught hiding in Kurdish
territory. Killed "bin Laden"/bushite forces! Now, bushite
tell US Sunni is in kahoots with Laden. (In otherwords, Kill
a cowardly enemy of Life bushite for America to defend Iraqis
as a godly act.) Death to the bushite, death to our enemies.

/ / Tariq Aziz, the Christian Iraqi Deputy Prime Minister
said in mid September that Baghdad had provided assistance to
America's Kurdish allies, the Patriotic Union of Kurdistan
(PUK), when forces supported by al Qaeda attacked them. He
said, ``We gave [Jalal] Talibani [leader of the PUK] weapons
and ammunition, we helped as much as we could. We are not
allowed of course to go into what is called the
semi-autonomous region of Kurdistan physically, but the help
we gave helped Talibani in his fight for it.'' In fact, added
Aziz, ``Talibani was among the opposition leaders who went to
Washington and spoke to Dick Cheney [US Vice-President] and
Rumsfeld. He told them what had happened, so they [US
government officials] must know.'' [Independent 9/23/02] \ \

-

Death to our indiscriminately murderous thieving enemies of
God's Creation, who war Creation for bush's personal escape
for the crimes of 911 Christ would say right, wouldn't you say
so likewise my brothers and sisters, of the Muslim, Christian,
and Jewish religions in belief?

-

Great words from the lawyer of the thieving bushite child killers of Haditha

/ / "There were Harriers dropping 500lb bombs on buildings. If they're dropping 500lb bombs without knocking on the door first, how can you argue the troops on the ground did anything wrong?" \ \

5000lbs of radio-active toxic waste that will murder for years more like, while after, then striking again to get the god helpers and screaming children, then even, as in Fallujah, going house to house to murder every one, young and old as the truly Satanic. Just obeying lawless orders to thieve from Humanity as bushite for neocon zionist traitors of G-D doesn't fly in the big book. When anyone kills a bushite, all humanity benefits truly from the defense. You defend a real suffering God by ending a soulless bushite threat against our species.

Bill Sattler.

-

http://www.informationliberation.com/?id=19646

/ / to think that these could have been just dumb ideas or incompetence. (L. Paul Bremer, for instance, who made the "dumb" decision about dismantling the Iraqi army, prior to becoming Iraq's occupation viceroy, had headed the nation's leading risk assessment consultancy, and surely knew what all the risks were of his various decisions.) \ \

Bushite TRAITORS got rid of the ORHA plan.

-

Exit strategy to save the lives of dying Americans:

War bushite LIAR zionist repuglicons who did God wrong on 911

War bushite who LIE to American Sons and Daughters to not hunt those who stole billions with ear-marks, Social Security, no-bid contracts, Iraqi oil, ect.

War those who stole the Iraq Development Fund, and the emergency monies left to save the lives of our dying children

War bushite who feed soldiers radio-active toxic waste as harmless

War bushite who support torturing the innocent to death

War bushite who sing about the joys of murdering Iraqi children

War bushite who beat to death barefoot Iraqi children

War bushite who jokingly beat lamed dogs for fun

War bushite who claim they are lawlessly un-accountable as liars.

War bushite in the air force who target bombing innocent People
like in Fallujah or Somalia with land mines and mini nukes

The godless as lawless bushite is the enemy to America, kill
it proudly for freedom, as an undying love for a real God and
Humanity.

-

-

/ / she told The Nation. "If I contribute to the Army's
prosecution of Lieutenant Watada on speech-related charges, I
will have colluded in suppression of speech. What could be
more hostile to the ideas of a free press than that?" \ \

Again, a Patriot Soldier whos only crime is that he refuses
to commit a crime in Your name. Do something about it.

-

Real Americans are those of US as humanity that believe
in liberty as Justice for all. Demon bushite nazi
whores, don't like those principles of freedom through
evidentiary findings though, for their false deity,
George W. bush Jr, wouldn't be stealing from the honest
hard working blokes who live for a better day that way.

-

/ / Four US oil companies, namely Conoco, Chevron, Amoco and
Philips have concessions in nearly two thirds of Somalia.
This quartet of oil conglomerates was granted these contracts
in the final days of Somalia's deposed dictator, Siad Barre.

The US first military engagement in Somalia was fully
supported by Conoco. \ \

In the new world, these soulless bomber bushite of the air
force, responsible for blatant first degree acts of murder
against the innocent, would be hunted down by Humans, tried,
then executed gloriously in the defense of our living justly.

-

/ / Al-Maliki has promised he will no longer block action
against the Mahdi Army militia \ \

So, is the block head saying American soldiers so far have died for lawless tyranny? Kill a bushite, to protect the lives of us as innocent victims in other words, right?

-

How Bush misled the world

http://www.theage.com.au/handheld/articles/2004/02/05/1075853996640.html

/ / Once the document was declassified after the war it became known that it contained 40 caveats - including 15 uses of "probably", all of which had been removed from the previously published version. Tenet further ingratiated himself by remaining silent about the OSP. "That's totally unacceptable for a CIA director," said Thielman. \ \

Thielman meant "totally unacceptable" as in HIGH TREASON. Could it be any higher? Deliberately caught misleading whore-dumb Congress to wage his immoral neocon 'escape' with a unjustified criminal brutality against God as all of our Humanity. A great deal more than a million innocent people have been victims to the 'targeted' Zionist killings of the irrational bushite enemy. Lawless enemies to Creation, spreading their toxic waste who thieve, rape and murder without reprimand from corporate news america, shall, I pray daily, die justly in vengeances by the will of a real undying Love for our victimized innocent family. Justice for Humanity.

Please, help US.

The guilty party of Haditha have confessed that targeted killing of innocent children is fair game in their worlds, and as confessed, they 'got away' committing the same Satanic acts - going house to house in fallujah murdering more than two hundred thousand innocent folks for LIAR E-N-E-M-Y Sattler. Bushite corporate america, has stated in silence, the bushite enemies of Haditha will never face public execution for such offences, YOU apparently WILL NOT GRANT IT, too cowardly, and in all likelihood, (like those of the Saudi Blount's third infantry) will be allowed to walk freely down american streets after being found guilty as politically supporting the robbing and murder of innocent men, women, and children all because we're rag-heads or niggers. The, deserving to die as illiterately intolerable bushite drone soldiers HAPPILY, WITHOUT QUESTION, co-operate with ANY lawless mercenary forces such as south african death squad goons in finding the enemies of themselves. Purposelessly ungodly bushite soldiers are told they are DYING to defend Iraqis, while breaking out of prison, mercenaries caught trying to kill innocent Iraqis for fun and profit. While, at the same time, actually having SLAVES from India preparing their lunches!!! And guess what? they're coming to live bushite america as the patriots after

they get killed you're forsaken American Son or Daughter teen!
With millions of stolen American dollars to set up new
'freedom' operations.

Let US demand open radio
communications on the mathimatical facts to save our own
selves further victimhood to their personal contempt for the
true value of YOUR life. Thanks.

Can you help us speak this outrage to your local media outlets?

thanks again bud.

Death to the godless bushite, death to America's lawless enemies

DUMFUK BUSHITE ENEMY OF GOD "This is not a job in anyway
shape or form, this is not a job. this is a lifestyle. and
we choose this type of lifestyle."

Traitor LIAR Hannity "Knowing the danger?"

DUMFUK BUSHITE ENEMY OF GOD "Yeah."

Traitor LIAR Hannity "Well, isn't that the definition of Bravery?"

The DUMFUK ENEMY OF CHRIST "Uhhuh."

See, TRAITOR Hannity [who deserves to be executed for the
treasonous DOCUMENTED lies he tells America almost daily]
would claim any and all serial murderers and rapists in
America are the definition of bravery. Bushite dumfuks
deserve to die as enemies of America because they openly,
purposefully target the innocent to rob from and murder, as
bushite did on 911.

Americans would rather DIE, than
hunt George Norry, or Art bell for questioning. A nation of
fascist nazi cowards, who go silently to their graves in their
support of torturing innocent people to death for the thieving
EVIL bushite's pleasure.

Death to the godless bushite, death to America's lawless enemies.

/ / "How could I order men to die for something I believe is
wrong?" \ \

They eat radio-active toxic waste before asking, why would
we eat radio-active toxic waste without thinking?

-

"For every fatal shooting, there were roughly three non-fatal
shootings. And, folks, this is unacceptable in America. It's
just unacceptable. And we're going to do something about it."

--

A Soldier's Life Held in Contempt

The way I see it, is that I am completely documented correct on who was responsible for the terrorist crimes of 9/11.
snpd

The affidavit that starts "1. National Security Issues" was submitted in conjunction with my motion to request assistance from the Court. The additional paper "Stand Together or Don't", was an added part of the same affidavit.

The affidavit with 38 positions was submitted with the two motions, "Order of Production" and "for the Crown to Stay Proceedings". Duplicate copies of the same affidavit were

submitted in each respect.

-

/ / In another characteristic incident, Bush asserted, as he has repeatedly, that any decision on withdrawal of American troops from Iraq "will be made by military commanders, not by politicians in Washington DC." \ \

Exactly. The demon enemy of life itself, Our Mr. bush Jnr., who publicly parades his contempt for freedom and God, must be stopped for all costs, that include for sure, your own as reader.

Realize, CNN and CBC have received this post, yet, continue to lie to dying soldiers for the benefit of the enemy neo-con.

-

AFFIDAVIT

AFFIDAVIT OF JOHNNY WIZARD

I, Johnny Wizard, in the city of Winnipeg, Province of Manitoba MAKE OATH AND SAY:

1.

Pakistani ISI Director General Ahmad orders an aide to wire transfer about $100,000 to hijacker Atta. Ahmad later resigns after the transfer is disclosed in India and confirmed by the FBI. [Dawn, 10/8/01, Times of India, 10/9/01, Wall Street Journal, 10/10/01, AFP, 10/10/01]

2.

On March 3, 2002, MSNBC's Jim Miklaszewski reported that he had received anonymously, top secret presidential war strategy documents dated September 9th, 2001, originating from Condolezza's office, outlining a strategy to invade Afghanistan premised on blaming bin Laden a terrorist, but providing no evidence to back up the allegations, thereby guaranteeing criminal invasion. Only workable if Laden pleads innocence to a crime that hadn't yet taken place, a crime serious enough to "justify" sacrificing American GIs truly for a liquefied natural gas pipe line for pension thieving Enron. ["The Dahbol Working Group" and Bridas] Any evidence for any offense would have been sufficient to have Muslim fundamentalists hand Laden immediately over, as they had offered [as others of other nations had also] repeatedly during the Clinton years.

CBC and CNN have still, to this day, consciously refused to do any follow up on the intelligence, deciding instead on behalf

of dying people everywhere, our public devolvement of a just society.

3.

RTÉ News - US rejects Taliban bin Laden evidence calls
21 September 2001 17:41

The White House has rejected requests from Afghanistan's ruling Taliban for proof that Osama bin Laden was responsible for last week's attacks. According to the US Secretary of State, Colin Powell, the United States has enough evidence to try bin Laden in an American court.

The US Government said there would be no negotiations.

4.

[This following document was the official damning account]

Responsibility for the terrorist atrocities in the United States
4 October 2001
http://www.pm.gov.uk/output/page3554.asp

[This Internet Domain is Britain's Prime Minister's]

"This document does not purport to provide a prosecutable case against Usama Bin Laden in a court of law."

The document doesn't hold ANY case, as that was the strategy.... See?

5.

Investigating the Investigation

http://www.alternet.org/story.html?StoryID=17816

After playing a tape of Cheney's statement, Russert asked Daschle, "Did the vice president call you and urge you not to investigate the events of Sept. 11?" Daschle flatly contradicted Cheney: "Yes, he did, Tim, on Jan. 24, and then on Jan. 28 the president himself at one of our breakfast meetings repeated the request."

6.

ABCNEWS.com : FBI Called off Terror Investigations
http://abcnews.go.com/sections/primetime/DailyNews/FBI_whistleblowers021219.html

Two veteran FBI investigators say they were ordered to stop investigations into a suspected terror cell linked to Osama bin Laden's al Qaeda network and the Sept. 11 attacks...

`You Will Not Open Criminal Investigations'

7.

October 9 2001 - The Times of India

"While the Pakistani Inter Services Public Relations claimed

that former ISI [the "Pakistani CIA"] director-general Lt-Gen Mahmud Ahmad sought retirement after being superseded on Monday, the truth is more shocking.

8.

No evidence was brought against Laden for nine eleven, none. [So according to Bush's official top secret Presidential directives] While Laden himself claimed he played no part in 911. Still, to save the lives of third worlders on the brink of starvation,

9.

former FBI deputy director and murder victim John O'Neill

"the main obstacles to investigating Islamic terrorism were

U.S. oil corporate interests and the role played by Saudi Arabia."

10.

Alex Jones interviewing Former German Defense Minister Andreas Von Buelow

"Bush signed W199I months before 911 ordering the FBI not to stop Al-Qaeda. They threatened to arrest FBI agent Robert Wright if he tells us what he knows."

11.

Mr. Bush was quoted somewhere regarding Mr. Laden's guilt of complete innocence with "We don't need any evidence, we know he's guilty."

12.

www.govexec.com/column/forwardTodaysColumn.cfm?sectionID=14

" [FBI's] Edmonds concluded that documents clearly showed that the Sept. 11 hijackers were in the country and plotting to use airplanes as missiles. She said documents also included information relating to their financial activities. "

13.

The honorable Argentinean oil company Bridas' relationship can not be understated as the Bush Administration's primary motive on criminal invasion of Afghanistan to save his biggest corporate backers, the American pension thieving Enron.

[snpd]

33.

Blix nor Elbaradei, nor Kofi, suggested, implied, or stated, that Iraq had failed to comply with the newest U.N. resolution: 1441.

HANS BLIX: "And at this juncture, we are able to perform professional no-notice inspections all over Iraq and to increase aerial surveillance..."

With complete, one hundred percent access to go where ever the Bush Administration pleased without delay, left a situation of an unjust war only detrimental to an ability to bring about any good or better thing. American soldiers are being sacrificed for no better good or reason understood, for if progress will ever be made, it will be when they work to bring about a political situation that was there in Iraq before the Bush Administration starting murdering innocent people for nothing . Well, not completely, for Bremer shipped 19 billion to Greenspan early on, then, hundreds of millions were sent back.

34.

Professor Steven E. Jones, a tenured BYU professor, went public several weeks ago after releasing a 19 page academic paper, essentially showing how the laws of physics do not support the WTC's freefall[...]

35.

"To be truthful about it, there was no way we could have got the public consent to have suddenly launched a campaign on Afghanistan but for what happened on September 11..."

Tony Blair Speaking To House of Commons Liaison Committee

36.

The Washington Post, 23 September 2001.

At American urging, Ahmed traveled ... to Kandahar, Afghanistan.

-

Since I am representing myself on these particular criminal matters, snpd I would request legal assistance from the Court in these following areas.

1. National Security Issues

<BIG SNP>

-

you know what is right, though you may still be blind, never too late to change your mind, we are all in agreement, in truth we rise, evil is just the deceived disguised...

STAND TOGETHER, OR DON'T

Our Gambling Problem

Instead of our government deciding what services we need and are willing to pay for, they'll have us think that by actively

promoting gambling to those we can take advantage of, somehow serves them right, and us well.

(snpd)

Are you feeling okay buddy? Let us get out of here, and go to talk.

-

HERO

/ / That is a high act of treason. And it's not, "oh well, but maybe it's not true.." No, we have the two documents of question. \ \

What is the Coast to Coast radio network Head talking about tonight?, the re-re-re-hashing of the "Allaways Interslinging" Bigfoot phenomenon? Where was I...

Look, you're not going to go to hell for not giving me a couple of dollars to further my cause, but it sure couldn't help to leave me without any support here whatsoever.

-

White House keeps dossiers on more than 10,000 'political enemies'

http://www.capitolhillblue.com/artman/publish/article_7625.shtml

-

WHICH SIDE ARE YOU ON?

/ / Specialist Damien "Monster" Corsetti--known affectionately as the "King of Torture" \ \

Will America hunt to kill the un-arrested bushite cancer that knows thyself as the "King of Torture"? Who's blasphemous open contempt for all that is God doesn't even earn him a spot on America's Most Wanted?

-

http://www.informationclearinghouse.info/article10785.htm

/ / an epic study that documents the systematic nature of torture by the Americans, and how casual it is, even enjoyable. . \ \

http://www.informationclearinghouse.info/article10362.htm

/ / [...] and it is treason. [...] \ \

/ / · less than one per cent of the population believes coalition forces are responsible for any improvement in security; \ \

(Don't miss "Johnny Wizard Vs. the bushmob")

/ / Who cares about yourself if you won't listen as reason to? What can you lose when you have granted to be blindly stolen from? \ \

-

http://www.cageprisoners.com/articles.php?id=10136

/ / Irwin Cotler's credo is supposed to be "Justice, justice shall you pursue" not ingratiation with superpowers who practice torture. \ \

-

"THEY SAY THEY TOOK OUR LAND. BUT WHERE DID THEY TAKE IT?"
--DAVID MONONGWE (Hopi)

"Epiphany"

http://ntimc.org/newswire.php?story_id=308&media_type=TEXT

/ / In fact, as they made clear on page one, the authors had stripped out Falluja; their estimate of 98,000 deaths would otherwise have been much higher. \ \

-

/ / Why does any American think that spying without a warrant has any more effect in reducing the threat of terrorism than spying with a warrant? \ \

Yet, FOX, CNN and CBC silently plead ignorance when broadcasting for bushite favor on this rights issue. He wants to pursue terrorists they'll tell us, but CNN, CBC, FOX and others, won't tell us why Bush secretly feels FISA would jeopardize such claimed inquiries? Sure, bushites are dumb, but we're not that dumb to except this without knowing. It's similarly like, Bush can't be my Chief because, Congress didn't declare war like the Constitution Laws. So, what's he going by then?, right?

-

True Blue American Jew

http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=25994

/ / When hundreds of millions are calling for the
extermination of the Jews of Israel this is more than a lie;
it is a blood libel. \ \

What is wrong with this ungodly stupid zionist demon nazi fuk
eh? snpd Americans beware
of the Zionist in your midst who LIES to cheat and steal from
the innocent true blue American Jew included.

-

Now that atheist THIEF Israel has 'legalized' MURDER,

/ / "Israel is embarking upon a more aggressive approach to
the war on terror that will include staging targeted killings
in the United States and other friendly countries, former
Israeli intelligence officials told United Press
International. \ \ The zionist criminal element can't call
OUR COPS we see... and with enemies like these... We should
don our stars an crosses, load our guns, and hunt to kill
every last 'escaped' first degree murderer zionist,
no...?

-

No evidence against an accused is US being truly abused

"These are not terrorists, they are not al-Qeada, they are

ordinary innocent men, women and children."

http://www.prisonplanet.tv/audio/131206rivero.mp3

-

Ahmad funded Atta

American soldiers are being terribly mislead by the Bush
administration to undermine freedom for Americans, by
suggesting an effective war strategy is to ignore all the 911
evidence, and go off instead to blindly blame bad Afghans or
badder Iraqis, is an insult to all honorable police services.
Services not left permanently perplexed by the onslaught of
repeatedly ignoring the same consequences where more innocent
people fall dead as bombing victims, while LIAR bushite
continue to charge/thieve from both, you as an American, and
me, a member of our victimized Humanity. You see, your demon
liar has ruled that all the Peoples of Earth have no legal
rights to exist freely in our public court rooms. Bad news
that is for OUR dying America my friend. Support my call for
an open dialog on returning a reason for believing, for
Freedom is Justice, not a censored world ruled by puppet

people in shadows without free will left un-accountable.

for the Delrin PFTE. It looks like very similar effects. It is something
that this very stable chemical undergoes such a transformation when very
hot.

What bothered me a little bit was that this stuff is used in fireworks.

83. Time to brush up on 700Mhz Antennas ...

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-04 03:07:24 UTC
From: John Smith I <assemblywizard@gmail.com>
Message-ID: <f90qht$j9l$1@nnrp.linuxfan.it>
Source record: 37647

With the future sale of a chunk of old tv @ 700Mhz, we will soon see
questions about these antennas for a new breed of hardware ...

In the mean time, the FCC is going to assure large telecom corps to
maintain and expand their strangle hold on services, this will start
getting you up to speed:

http://www.msnbc.msn.com/id/20108087/

Our criminal political system shafts us yet one more time ... :-(

Regards,
JS

84. Mark Morgan's continued abuse of Amateur Radio groups

Newsgroup: rec.radio.amateur.antenna

For whatever good it may or may not do, I've already sent a complaint to
Tera News regarding Mr Morgan's abuse of the Amateur Radio newsgroups.

I understand that others have, or are following suit.

186 posts to r.r.a.p on Aug 2 and 183 posts on Aug 3 are excessive by any
stretch of the imagination.

Nor is this unusual, for there has been many a month when KB9RQZ has made
1500 to 1600 posts in the Amateur Radio groups and has gone on record as
stating that his sole purpose was to disrupt the groups with repetitive
posts.
It is because of him that rec.radio.amateur.moderated was formed. He has
subsequently been banned from that newsgroup AND from posting to QRZ.com as
well.

I plan next to document his continued abuse, print it out, and mail it to
Tera News located in Osceola, Indiana on the outside chance that Tera News
does not read the complaints emailed to them.
If he continues and Tera News fails to respond, I next plan to send a
missive to his provider, Hughes Net.

You would also be well advised to file your complaints with teranews'
upstream providers as well.

For example, Teranews is serviced by NetStream/Fiber Communications:

Netstream/Fiber Communications
3300 Douglas Blvd Suite 450
Roseville, CA 95661
916.780.0707

Which is in turn fed by

Internap Network Services
Suite E-100
250 Williams Street NW
Atlanta, GA 30303
404.302.9700

SHORT 75/40M DIPOLE
75/40 Meter Coil Loaded Dipole, less than 85 ft. In length, similar to the Alpha Delta DX-DD but made with 12 & 14 gauge hard drawn copper wire not soft house wire, Pre-tuned to the voice segments of the 75/40 meter bands. Coax fed and can be hung as a flat top or inverted Vee. 50 KHz or better less than 2:1 SWR on 75 and below 2:1 across the full 150 KHz of the 40 meter voice segment. Will cover all of 75 meters using an antenna tuner. Can use on some higher HF bands using a tuner. Will handle up to 300 watts.

====================================
Butternut manufacturer ' Bencher' has now provided the following info :
QUOTE
Coil Q Base Matching - can be made out of 17 turns of 12 awg magnet wire
wound on a 1 1/4 inch (31.8 mm) form.

Coax 75 Ohm Matching Line - made from RG-11 75 ohm coax, 11 ft 4 inches
(345.4 cm) if solid dielectric, 13 ft 6 in (411.5 cm) if foam type.
UNQUOTE

I am happy with the above . This item can be closed.

93. Hammer drills and ground rods, followup

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-04 15:18:56 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.04.15.18.55.96373@from.qrz.com>
Source record: 37657

Today I rented a hammer drill and a fitting for driving in ground rods (they even had the right fitting even though they didn't know it and didn't know what I was talking about...).

MAN, DOES THAT THING WORK NICE !!!

Took about two hours to drive 7 rods, after the first one (that I did manually with a sledge hammer) took about 10 hours spread out over a week (just for one).

Those of you who suggested a hammer drill really had it right, and saved my butt... thanks. :-)

Somebody mentioned something about a battery-powered hammer drill. I haven't been able to find anything like that... can someone tell me who makes one?

Thanks again... :-)

IMO they are too light weight to do your job application. They
normally are used for drilling small and shallow holes.

But here's some info.

Hey - - great news. Thanks for telling us. Now, is there any chance you
might know what brand and model number of hammer drill you used? If you
know the model number of the fitting, that would help, too. Ideally it would
be fun to be able to find the model numbers in the manufacturer's catalog to
see what everything looks like, so when we go to the rental place, we can
tell if they have the right stuff, even if they don't know it themselves.

Thanks for the additional link.

I had the problem of stripping some very fine PTFE insulated wire some years ago, and had to search a bit to find a stripper to do it. It was fairly expensive, and was a lot like a conventional wire stripper except that the insulation was cut by means of a couple of blades which momentarily heated to red hot temperature when they came together over the wire. I'm sure I breathed some of the resulting fumes, with no ill effects. I wonder how much exposure is necessary in order to produce the symptoms listed in the hazard sheet.

In any case, I doubt that many amateurs use a thermal stripper for PTFE. I do fairly routinely heat PTFE insulated semi-rigid coaxial cable to around 350 C (700 F) when soldering it. That results in extrusion of PTFE from the tube, but no obvious fumes. And so far none of the symptoms listed in the hazard sheet.

I'd think that a Teflon coated frying pan could easily reach 300 - 400 C. What's the function of PTFE in fireworks?

Rick,

I see on Hilti's web site he TE-76-ATC, and its accessories include a TE-Y driving shank and a series of adapters TP-TKS ground rod driving adapters for different diameters.

Hilti BTW are suppliers of expensive quality tools to the construction industry, you probably won't find their tools in home handyman stores.

The tool you rented is a little lighter than the one I used, and that is probably why driving times were a little longer. My Hitach PH-65 machine with home made driving adapter will drive a 16mm diameter 2.4m earth rod into dry clay in less than a minute.

Pleased it worked for you. It is the way to go, isn't it!

The numbers above might help people looking to rent a device.

Owen

None of those drills is suitable for driving ground rods. They are all regular electric drills, with a conventional 3-jaw chuck and a lightweight hammer action that depends on the chuck going round.

For driving ground rods, you need a different kind of 'hammer' drill that has a separate high-impact hammer action, that can be used *without* the chuck going round.

The SDS+ system is the Bosch company's patented method to build hand-held electric drills with a *serious* high-impact hammer action. The system has been widely licensed to other manufacturers, so all SDS+ drills are basically the same. They all have a snap-lock chuck (if it has a 3-jaw chuck, it ain't SDS) that takes a wide range of heavy-duty drill bits and tools. Most have a shift lever that gives you the choice between rotary action on its own, hammer action on its own, or both together - all in a drill that you can hold in one hand. It makes those old-style hammer drills look like toys.

The Hilti TE-76-ATC that Rick rented is based on the SDS Max system, the 'big brother' to SDS+, so it's no wonder those ground rods went right in.

I've never paid attention to the tool they use
when they put up the tent at the Charlotte show,
but it'll drive a 1 inch solid tent stake through
the asphalt parking lot like it's butter.

I've never been there to see what they have to do to pull
them out when the tent comes down.
The stakes sure hold the tent fine.

I'd like to drive a ground rod near the point where
the coax hooks to the ladder line from my G5RV,
but it's next to a large oak tree.
I can just imagine what getting through all those
roots would be like.

I used to use a type that had jaws that clamped down on the wire from
the front, and after heating up you would just pull and the insulation
would come off. They were kind of nice because you just didn't nick a
wire ever with them.

I could even use a regular pair of strippers, although they would leave
a little nib of insulation that I had to trim off with a nippper.

While I suspect that the thermal strippers are probably safe, I have to
say that the fumes given off were pretty unpleasant.

400 C is the apparant magic temp. Below that it is pretty inert.

> I'd think that a Teflon coated frying pan could easily reach 300 - 400
> C.

There has been accounts of Teflon pans overheating and causing harm to
pet birds. I've looked at some of the evidence, and although some of the
people are kooks, I think that a badly overheated pan will release HF
gas.

What's the function of PTFE in fireworks?

It is used as an oxidizer.

Yeah, I have no idea what the part number is, there wasn't one on the fitting. It has an SDS Max (that's the next bigger one than SDS Plus, right?) shaft that goes into the chuck of the drill, then that is fastened to a sort of a cup fitting that fits over the end of the ground rod.

Sounds a lot like the slinky dipole.
Use one slinky on each pole and its a 40-meter -or use 2 on each side for an 80-meter antenna.
I saw one but never tried it myself.

A compressor and an air chisel do exactly that, and 16mm rod will directly
fit into most chisels.

Reverse SMA connectors and thin coax are both available cheaply, why go to the bother of destroying an antenna.

It is also possible to get the female pin from a line SMA socket to fit into an SMA plug, if you have not a reverse SMA plug.

Subwoofer/Amp project...

(Playmaster 300W subwoofer amp)

While walking down the hall around lunch time I walked in on a discussion about surround sound home theater systems. After humbly admitting I watched movies through my two channel stereo I was prodded by my peers to get with the '90s, I started checking out the technology.

The following week I saw a used Carver surround sound processor for sale on the net. Perfect for upgrading my late 80's vintage two channel stereo. However, a suround sound system requires three front speakers (left, center, right), two rear (left and right), and a subwoofer. The five channels provide the spacial realism, while the subwoofer provides the physical realism... that is when Apollo 13 takes off one should be able to feel the vibrations in the chest, and when the horses cross the battle field in braveheart, it's the subwoofer that allows one to feel the horses through the vibrating floor.

While I had other equipment to get by on the five channels, I was short on a subwoofer, so I did some research. The short story is that I built my own powered subwoofer (actually 2) and learned alot in the process.

Here are the details...

Some info on subwoofers
Speaker Building Information Sources
Subwoofer Project
Subwoofer Construction
Amplifier Construction

Some info on subwoofers...
Difference between a woofer and a subwoofer... subwoofers are usually only used to recreate a sub portion of what a woofer will. While a typical woofer may have a frequency response between 20Hz and 2k Hz, a subwoofer usually has a crossover that limits it's frequency response range from 20Hz to maybe 80-150Hz. Component wise (the cone/coil thing) woofers and subwoofers are the same. There are passive subwoofers and powered subwoofers. Passive subwoofers are powered by your stereo's amplifier. Powered subwoofers is the same as a passive subwoofer except it has it's own amplifier for driving the passive subwoofer. Your stereo needs to have a sub woofer out (line out) for a

powered subwoofer. Since most power produced by your stereo's amp is consumed by driving the low frequencies of your speakers, it's a big win to have a separate amplifier for driving the low end. This way mid range won't suffer from the power consumed by the low end.
There are several designs for a subwoofers. Some of the less exotic ones are are ported, sealed, and band pass enclosures. Sealed enclosure's advantage is that they can exist in a much smaller enclosure, however this is at the cost of efficiency and reduced low frequency performance. Ported enclosures are the most common. These have a tube called a port which serves several purposes. It's important that this port be tuned to the driver (woofer) and volume of the box or else the sound may result in unclear, muddy bass. The affect of a properly tuned port with the woofer is similar to blowing a wine jug like an instrument. A band pass enclsure looks like a box with a hole or slit. Bose subwoofers are band pass woofers. The idea is that only certain desired frequencies (bands) end up passing through the hole or slit while the others are absorbed internally.

There's a thing called a crossover to consider. A crossover is like a frequency filter except rather than filtering out frequencies, it redirects frequencies to other channels. A typical powered subwoofer will have a built in crossover that directs low end frequencies (usually < 80-150Hz) to your subwoofer while sending higher frequencies on to another channel (the rest of your speaker system). The high end frequencies rapidly diminish in the channel sent to the subwoofer and the low end frequencies rapidly dimish in the channel going to the higher frequency response speakers. So the tweeters get the high frequencies they are designed to produce and the woofer get the low frequencies they are designed to produce. Almost all multi speaker system will have some sort of crossover. separating frequencies between tweeter, midrange and woofer. In crossovers, there are both passive and active crossovers. Passive crossovers are typical in most speakers. Since they take their power from the incoming signal, they do have an impact on power/responsiveness. Active crossovers get there power externally. However we're starting to go beyond the scope of the subwoofers project.

The prices for powered subwoofer can get pretty expensive. I was looking at models between $200 and $1500. $1500 for a 12 or 15 inch woofer plus amplifier just seemed ridiculous considering the cost of parts to make them... So, I decided to look into making my own. The route I chose to take was not cost effective if time for learning, designing, and implementing is factored in. However what I've learned while doing this makes it all worth while.

Speaker Building Information Sources
I started with two books I picked up at Radio Shack called Speaker Building and Advanced Speaker building. Both are heavily oriented torwards building speakers with Radio Shack speaker components, and

can almost double as a Radio Shack speaker catalog. Lot's of shameless Radio Shack marketing through out. They have a nice intro into building speakers, with a lot of the theory left out. The first book contains graphs to crossreference parameters required to make a speaker so that one doesn't need to use a calculator. The advance speaker book throws in some formulas but is a little lacking in discussion on how the equations were derived. In case you don't know how to plug a formula into your calculator, no worries... the Advanced Radio Shack book will tell you which buttons to press.
Vance Dickason's "The Loudspeaker Design Cookbook" (ISBN 1-882580-10-9) was recommended by several sources. It reads like a collection of white papers on speaker building theory and is heavy on the technical side. Towards the end it contains several commercial advertisements for part sources. Good book.

There is quite a bit of wave theory, frequency dampening factors that needs to be taken in to consideration. Everything from cone tensile strength to acoustic frequency dampening of dacron fiber fluff or maybe beach sand, resonant frequency of particle board versus a harder wood, etc., etc. factor into the volume of the box and the optimal length of the port so that it resonates properly. So many factors, it takes some time to become comfortable with weeding out the meaningful parameters from those that are negligible in the quest for making the ultimate speaker. Box dimension I later learned really dosn't matter much for a subwoofer. The main concern in box dimension is standing waves where waves are cancelled out to the tune of +/- 5dB in the worst case. Sufficient dampening material inside to absorb standing waves can cancel this out. In the case of subwoofers, it's not an issue since the box dimensions are so much shorter than the wavelengths (20-100Hz).

Here are some information sights I've found on the web....

Subwoofer Project
Being a neophyte in the audiophile world, my first thought was to get the biggest driver I could find to produce the lows and push volumes of air that one could feel. I ran across some 18" woofers, however I liked the specs on some 15" woofers I later found better. After doing

the calculations I found that for my ported cabinet, I would need an enclosure that was 14 to 24 cubic feet! I decided that there is no way I would want to dedicate this much space in my living room to a box this big. These calculation were based off of an optimal volume formula I got out of the Radio Shack books. I later discovered that this optimal volume didn't agree with the manufacturer, several software design packages, and the loudspeaker cookbook.
An alternative was to go with a sealed enclosure, however this reduces the responsiveness and pushes the F3 upwards. End result is a subwoofer with a reduced ability to produce low end. Since it seems the whole point of having a subwoofer is to produce the low frequencies, a sealed enclosure which raises the low end didn't make much sense to me.

I opted for a 12" woofer with a 3 cubic foot enclosure. I decided to go with Ultimate's AU1290 "Attitude" woofers. They have a frequency response range of 18-1k Hz. They have a dual six ohm, 90oz magnet, 2" kapton coil capable of handling 500 watts sustained, 1000 watts max. Headroom is .44". SPL is 88.9dB, but I don't care about this since it'll be driven by it's own separate amp with it's own gain control.

Test Data from Factory:
SPL 88.9dB 1W/1m
Fs 23.5Hz
Vas 5.3
Qts .38

I decided to go with 3 cubic feet ported enclosure since that would give me the lowest frequency within factory recommendations.... With a 3 cubic foot enclosure, this driver has an F3 of about 26Hz (pretty good!). I decided to go with a 4" diameter port tube since that would give me the least amount of port noise. The port for this is about 14" long. I ended up picking up some PVC tube at the hardware store. This worked quite well.

Subwoofer Construction
I decided to make a prototype out of particle board since wide oak boards are expensive and I was afraid of ruining them, especially since I have very little wood working experience. Particle board cost about 1/8 the price.
Being new to wood working I only had a circular saw which I had learned through experience is not for precision wood working. I was able to pick a used craftsman table saw in perfect shape for about a third of the price of a new one. And this is what I built the prototype with. For the speaker and port hole I used a saber saw.

The prototype came out pretty good. Some things I learned from the prototype is that cross bracing is important so as to cut down on the side board vibrations. Also, all seams should have a good fit and must be well sealed. I used some silicone wood calk I picked up at the

hardware store. If the seams aren't sealed, the gaps tend to make a raspy whistling noise when the driver is pushing large volumes of air.

I picked up a used 60's vintage radial arm saw which I found for about 1/5 the price of an equivalent new one, however it needed some work. I spent a Saturday cleaning, oiling, calibrating, and building a new rip fence for it. I discoverd that a radial arm saw is really the way to go for precision cuts. Rather than moving a big block of heavy wood towards the blade, the heavy material stays in place while the blade runs along a track and makes a perfect precision cut. The end result is that the oak boards had a much smaller seam between the boards in the cabinet. I think this will help reduce board vibration as well as make it easier to seal.

I put about 2 pounds of a Dacron fiber called "Acousta-stuff". Supposedly it's better than Dacron fiber that one can get at a craft/ fabric shop because the fibers are triangular rather than round..... Don't know about that, but the Loud speaker cookbook had some test results that said it was better, so I paid $8 per pound for this fluff. Fiber glass is suppose to be better, but for other reasons I decided I didn't want to use that. Dampening material is important for the speaker so as reduce standing waves in the enclosure which can mess with sound to the tune of a variable +/- 5dB! I just stapled this to the side of the walls excluding top and near the port tube.

I picked up a gold plated 8 post screw/banana speaker terminal which is intended for a dual voice coil subwoofer with individual crossover for each channel for hook up to additional speakers. Currently I use the active crossover from the subwoofer out in the Carver surround sound processor, so I've delayed on the passive crossover for now.

I have some small Polk speakers (4b?) I'm using as the satelite front channel speakers now. They have a 6.25" woofer. I don't have any performance spcse on these speakers.... so I'm guestimating by looking at other 6.25" of comparable quality that they will begin their roll off around 100Hz. I'm considering putting together a 2nd order low pass filter at 100Hz for the subwoofer. I had underestimated the cost for a crossover for this subwoofer. Doing some rough calculations for this low 100Hz filter looks like I'll need a 12mH inductor coil and ~200uF capacitor. Because of the high power nature of this subwoofer, I'm looking at $15-$30 for the inductor, and ~$50 for the capacitor.... Since this is a dual coil driver, everything will be mulitplied by two.

Amplifier Construction
I needed a mono amplifier to drive this subwoofer. While a cheap and easy way to do this would be to buy a bridgeable automobile amp, I had been looking for an excuse to build my own amplifier. Acoustic Labs has designed several high end amplifiers. Their designs are then

marketed as "high end audio" project kits. Mark V Electronics, Inc. - Mark V Electronics, Inc. 8019 E. Slauson Ave. Montebello, CA 90640 Phone: 323-888-8988 http://www.markvelectronics.com/store E-mail: MARK5CO@aol.com http://www.markvelectronics.com -out of California markets. A mono amplifier(s) has a lot of uses in a component stereo system, especially in a 5.1 channel AC-3 or Dolby Pro Logic (THX) surround sound system that I can see using it for the forseeable future. As such, my thinking was... if I'm going to put all the time into making this, why not start with the best possible design. I decided on the AF-3 design which is a 300 Watt constant current MOSFET amp. MOSFET amps are known for having very similar characteristics to pentode vacume tubes without the drawbacks of being a vacume tube. The design has a built in speaker protection cicuit relay for protecting the speaker from power surge during power up. The design, PCB, mega heatsinks, and components that go on the PCB sell for $165. Not bad I thought... that is until I picked up everthing else I needed. The design calls for 4 filter 80-100 volt 10k uF capacitors which sell for about $25 each with mounting hardware. I picked up an 8 amp toroidal transformer (low hum, low EMF) for $66. Also I needed a cabinet of which I found a nice black anodized aluminum vented case with rack handles for $44. Other miscelaneous components such as an optional (quiet 23dB) fan, gold plated mega 4AWG capable speaker binding post, wire, rectifier bridge, fuse holder, switch, some extra capacitor and high wattage resistors, etc. brought the total price up to roughly $400 for this mono channel amp. Had I known this would be the price ahead of time, I probably wouldn't have done it. However, I now rationalize that I've learned alot making it and that I have the best mono amp for my forseeable future needs.
I built two amps (Mom wanted one). Each amp took approximatly 50 hours assembly time. The end result is a nice sounding extremely powerful amp. 300 watts for this subwoofer is more than adequate. I have the subwoofer line out on the surround sound processor turned down to about as low as it will go. The subwoofer itself will handle 350 watts sustained, 500 watts peak. Watching the movie "Braveheart" during some of the battle scenes tends to set the whole house vibrating. One can feel the horses running across the wooden floors in the house.

After a couple weeks, I noticed the first amp I built would run much hotter than the other. I opened up the amp and recalibrated. There are two potentiometers that need to be adjusted. One is adjusted by reading the current to the amplifier board, the other is adjusted by zeroing the ouput voltage to the speaker when no input signal is present. I had adjusted these after assembling the amplifiers. However after running the amps for a while, one of the two potentiometers needed recalibrating. Now they seem to run at a reasonable temperature with my typical use.

I had picked up a 120 volt cooling fan at Radio Shack for cooling the amp. At the time, I didn't know how loud 38dB was which is what the fan noise was rated at. After trying it out, I decided this was too loud for an audio amplifier application. I found a 23dB fan + fan

guard in a Jameco Electronics catalog. It's quiet enough, however, cutting the hole in the metal case has become a problem. I found a 3" circular saw, however this requires a drill press that one can set at 100rpm and can apply 150 lbs of pressure. I don't own a drill press, and haven't found one that can operate as slow as 100 rpms. I just finished a welding class, where in addition to stick welding, MIG and TIG, we learned to use a plasma cutter which is as easy as using an exacto knife. I think if a circular wood template was made ahead of time, the plasma cutter would be the easiest. I think the local welding shops rent a 110 volt plasma cutter for about $40. ...an expensive hole. I also needed to cut the case to install the oversized speaker binding posts. I used a coping saw for this. It was hard frustrating work and the results were not very nice. Fortunately, the cut is hidden by the speaker post mount, and so doesn't matter. A plasma cutter would have been great for this too.

Even though components in the amplifier would probably last longer running cooler, I've decided to wait on installing a fan until I have a better understanding of how hot it will run and can justify all the trouble of installing one. This also gives me more time to think up some way to wire up a thermostat controller.

Having followed this thread for some time , my simple question is :

Are ground rods really necessary for a good " RF Earth " ?

Are buried or elevated radials or an area covered with '(galvanised)
wire mesh' not equally effective or even superior ?

For RF, yes. For lightning or safety ground, no.

You should be able to find a great deal of information about the different requirements for different grounds by searching previous postings of this newsgroup with groups.google.com.

For RF purposes, radials or mesh are more effective than ground rods.
Radials and mesh form a 'mirror' surface at RF effectively reflecting an
image of the elevated antenna radiating element. It is not necessary to
actually have a 'good' connection to real earth, just the antenna system.
This is why elevated radials can work.

The radiating portion of the antenna needs something to 'work' against. So
you have two choices, a monopole antenna which can be thought of as working
against it's reflection in the earth, or a dipole antenna where each antenna
element works against the other. Just about all antennas are variants of
these two methods.

If you have a rotary-hammer drill (as opposed to a plain hammer) you can use a very long spiral drill bit to make a pilot hole through all the roots, before hammering in the ground rod.

SDS masonry bits are available up to 1.0m long and will drill through almost anything, including tree roots and even solid rock. If you can drill a pilot hole, it almost guarantees that you'll be able to hammer in the first 3 feet of ground rod very easily. Beyond that depth, it depends what kind of ground you're in, and how far your luck holds out.

Wire mesh makes an excellent RF ground. It is particularly good for Field Days and DXpeditions because you can quickly roll out a large area of ground cover (typically in a '+' formation) and then roll it up again when you're done.

But never for a permanent installation! While clearing the ground at this new QTH, I ran into an impossible tangle of matted grass and bits of sharp, rusty mesh that turned out to be an abandoned chicken coop. We finally had to plane off the whole area with a dozer blade, and that still didn't get rid of it, of course - all we could do was push the problem out of the way.

Having experienced the legacy left by abandoned chicken mesh, I have vowed always to use conventional wire radials that can be pulled out easily after I'm gone.

The link below leads to a NEC-2 study of a short vertical monopole
for two mounting/operating conditions stated in the study.

It shows about a 13 dB advantage in the surface wave launched by
the roof-mounted configuration in this comparison.

Similar affects should apply to verticals used in the ham bands,
so this result might be useful to some readers here.

It would be more accurate to bill this
as "Mediocre radial system vs 20 m x 30
m solid aluminum ground screen ".

I suspect much the same results would
obtain for the roof mount, even if the
roof were at ground level.

73,

Chuck

Source record: 37693

Not an easy question. I have used both a 2L quad (Cubix) and a 3L SteppIR.

Although I cannot quantify it, I felt the quad was a better receiving antenna for dealing with very weak signals. (This was with separate feeds for each band.) The Cubix was well built, with good fiberglass spreaders. However, even at its best, a quad is a physical challenge. It is a large three-dimensional structure that can be very difficult for one person to handle. The SteppIR is a two-dimensional object and much easier to handle.

My quad had a remote switch (Amertron) to switch one feed coax to each of the five elements. This required a control cable for the switch. The SteppIR needs a control cable for the stepping motors. They are about even in this respect. The quad can be turned (and stopped) by a slightly smaller rotor.

My choice was the SteppIR on a crank-down/crank-over tower. In the long run, the ease of maintenance (and playing with the antenna and other wires on the tower) outweighed the lower price of the quad and the possibility of slightly better reception in extreme cases.

When the comparison is made between the roof-mounted version as shown in my PDF and an earth-mounted vertical using a 2-ohm "broadcast quality" r-f ground system of 120 buried radials each about 1/4-wave long, then the advantage of the roof-mount version drops to about 5 dB.

N.B. these radiators are electrically very short. Using taller radiators would reduce the performance difference.

It's interesting that you quote a Google source. Google invested $100,000,000
in BPL, which makes them IMHO part of the problem, not the solution.

Exactly which countries besides the U.S. have allowed it after testing it?

Geoff.

My mistake! I googled "hammer drill which was the wrong term, and device. Instead, I should have used the term "Rotary Hammer" which is the correct device one would use for driving ground rods. I have used a Bosch model for many years.... an excellent device for driving copper clad steel ground rods.... will actually crack and pierce rocks if they are in the way.

The correct Bosch device can be found at:

135. cutting end slots in aluminum tubing

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-05 18:37:33 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns9983766C81479spectrumhogstarbandn@198.186.192.196>
Source record: 37699

Just received my order of telescoping aluminum tubing rods from Texas Towers. Sizes range from 1" OD to smaller and all 6 feet long. I plan on using them as a collapsible verticle on the motor home. Before I start hack-sawing away on the ends to cut slots around which I will place my hose clamps, does anyone here have any particular tips or techniques to do this? I figure I'd just cut two slots with a hacksaw about 1" or so deep. If there's a better suggestion, I'd like to hear it before wacking away on my expensive tubes.

Ed

plan on going a bit deeper than that. you have to cut a long enough slot so that the hose clamp can easily clamp it down and provide enough surface area to prevent slippage. i would plan on about double the tube diameter for the length of the slot.

After you cut the slot use a round or half round file to take off the burrs inside or they can get between the tubes and make it hard to get them apart.

Sounds reasonable. My point was that the
entire 13 dB difference could probably
be explained in terms of the difference
in ground resistance (15 ohms vs 2 ohms
vs <1 ohm? for the aluminum roof) and
the extremely low radiation resistance.

I am afraid I "hear" that question as:

1) Exactly what countries developed the A-Bomb, before the USA?

2) Exactly what countries developed the desktop computer, before the USA?

3) Exactly what countries walked the Moon, before the USA?

4) Exactly what countries had "real" stealth aircraft, before the USA?

5) Etc., etc. ...

If we waited for other countries, we'd be in real trouble now, wouldn't we?

I don't think too many hams are using 10 foot high verticals on 160 meters -- not for transmitting, anyway.

Hello All,
I'm trying to put together a satellite station and know that I need
a mast mounted pre-amp for my receive antenna. I'll be using
Lindenblad antennas for both transmitting and receiving. I'm looking
for opinions on a good pre-amp, company and models. I know I need a
unit with a low noise floor, sub 1 Db.
Thanks,
Rob Brown

That would be ok as long as the combined width of the slots will allow the larger tubing to be clamped to the smaller tubing. I have always just used a hacksaw, and made slots 90° apart, making the slot length about twice the diameter of the tubing.

I was figuring on making only one set of slots, 180 degrees opposite.
This tubing is quite close fitting (a 9/1000 " difference between inside
and outside diamters) and will require very little compression of the
slotted end to make a tight fit, I would think.

>
> RF

I think that comparison would be flawed though. That is not an optimum
"elevated" radial system, and I can see it losing to a 120 radial
ground system. For one thing, the radial system is not resonant.
This is quite important for an elevated system. Fairly critical
really.
Also, the manner of the wires being laid out like chicken wire mesh
is not an optimum use of wire. You would have better results using
the usual "spoke radial" system, due to more wire being concentrated
at the feedpoint, vs farther out.
If you compared a ground mount with 120 radials vs a roof mount
with 120 radials, the roof mount would smoke the ground mount
handily. For sure, as far as the local "ground/space" wave.
Also, if this antenna was for MW, and roof mounted, which is
very low height in wavelength, you will need a lot of radials to
equal the 120 on the ground. But if you had the antenna at 1/4
wave up, about 10 radials would equal the 120 on the ground.
I often see and hear about MW comparisons using ground mount
vs elevated, and almost to a tee, most ruin the comparison by
applying substandard radial systems on the elevated antenna.
Either that, or they ignore the number of elevated radials needed
to equal the 120 on the ground. That of course varies with height
in wavelength.
At 1/2 wave, 3-4 radials will equal 120 on the ground.
At 1/4 wave, about 8-12 will be needed.
At 1/8 wave, about 60 or so at least..

And it just gets worse from there as you get lower and
lower. Less than 1/8 wave, and you will need a load of radials
to equal the 120 on the ground. Probably 80-100... ??
Anyway, I've done quite a bit of comparing elevated vs ground
mount on 40m, and there is absolutely no doubt in my mind
that elevated is the best way to go. Totally smokes a ground
mount, as long as the number of needed radials per wavelength
is not ignored.
Even if you equal the ground losses between the two, the
elevated still wins due to more clearance of ground clutter,
and a much better local ground/space wave signal, which
I assume is due to the radiator being high and in the clear.
More line of sight so to speak.. This also greatly improves
the lower angle DX coverage, being both use the same fairly
low angles of radiation.

From: francesco.messineo@gmail.com
Message-ID: <1186384476.701074.21980@q75g2000hsh.googlegroups.com>
Source record: 37715

Hello all,

I built in the years several Yagis (and other antennas). Until now all Yagis I built were calculated with the great program from DL6WU and fed with folded dipole and 4:1 coaxial balun with good results. A couple of them has been fed with gamma match and are working good but needed a lot of tweaking to have low SWR.
Two weeks ago I built a 6 elements yagi for the 70 MHz band, the design this time comes from YU7EF (http://www.yu1arc.com/yu7ef/EF0406.htm), it is made with 10mm elements supported over a 26mm boom (both aluminium). Element to boom spacing is 25mm (end to end) but there is a steel plate (35x55x2 mm) between each element and the boom. The plate is located ad 10mm from each element end (for end I mean the 5mm radius from the center of the element). Each element is supported in a plastic shell bolted to the steel plate with two steel bolts (not touching the element).
I didn't apply any correction factor to the elements, is this right or it's my first error with this antenna?
For the feeder I decided to try with a T match as described in the DL6WU program and the program itself gave me a 504mm as length for (each?) arm of the T match. The "dipole" isn't split in the middle obviously. Then there's the 4:1 coaxial balun and then about 12m of 50 ohm cable. I hadn't enough aluminium tubing for a folded dipole.
The antenna is mounted about 2m from the tip of the roof (V-inverted roof) and about 2m down a 2-lambda 2m yagi (no other place for it, really).
I expected to have a poor match and infacts with 1W forward I first got 100mW reflected (with the T shorts about at the full length of the matching arms). Also the actual reflected power depends on the direction of the antenna, beeing the roof quite polluted with metal of other antennas and poles, but it never reflects less than 80mW with 1W forward.
I then tried moving the shorts toward the boom to find a better match, but to my surprise I discovered almost no effect on reflected power. Now the shorts are about 220mm from the end of the matching arms and reflected power now peaks at about 85mW instead of 100mW, seems like too independent from the short position to be true.
The antenna indeed shows a directional pattern as it should. I tested with local noises and during an ES opening (heard a beacon 2000 km away, peaking at S7 when correctly turned and almost no audible with the side of the antenna), I also worked a station at about 2000 km with power output of less than 4W (but yes, during ES openings you can make QSO even with 1W in a dummy load).
Now I really wanted to understand why this T-match is so "broad", what

errors I might be doing? Can the poor placement of the antenna justify
this behaviour?
Thanks in advance

Francesco IZ8DWF

Judging on my experience as a mechanic and many years with fitting exhaust systems to cars, you need only one cut with the cut at least one and a half times the diameter of the smaller tube diameter.
I am now retired and experimenting with antennas, I use a slitting saw in my vertical mill, makes a beautiful cut!

Hi Rob

Thats a pretty wide open question... I don't have any model etc recommendations for you, but since nobody has replied to your question...

Suggest you read up (web) and understand the implications of preamps, then with understanding about gain, noise figure, IMD and power handling go and compare various manufacturers models. Relying on empirical "it worked well for me" from fellow amateurs is always fraught with danger!

Keep in mind that for some designs, best NF corresponds with really bad performance in an adjacent strong signal environment. Fiddling with gate bias current is a way to tune this to the best compromise.

You may also wish to review your choice of antennas. Higher gain and steering may be something you'll need (eg for using the higher orbit sats) and the wider pattern from the Lindenblad's may introduce more terrestrial noise than you want. My next experiment for sat work will be a quadrature fed interlaced 2/70 quad.. Cebik has some info on that..

If you are RX only you may even wish to build.

Cheers Bob VK2YQA

Hello Mr. Smith,

I still find BPL risky for any gains it might bring forth. As some broadband providers are looking to push into/beyond ethernet data rates, BPL brings to the table sub par data rates with the risk of RFI into a regulated natural resource.

BPL could be nice as a backup system, but it is my opinion that a high speed infrastructure is needed.

It has been really handy that the Mom and Pop grown Cable industry has provided some of this infrastructure.

If we are looking to do this without laying new cable, maybe a cellular structured microwave wireless network would work. I thought the new Wi-Fi was to provide for this?

Regards,

Chris

Hello Ed:

You may find that the hand hack saw will be difficult to control and keep the cut straight. I use a inexpensive Band Saw, and cut the slots approx 1 1/2 inches long. Another consideration is the cut slot width maybe to narrow to fully close the outer tubing down on the inner tubing. So making a another saw blade width will not hurt. Use a round or rat tail file to deburr the inside of the tubing. Chain Saw shaping files work quit well for this and are cheap.

You will see cheap crapp hose clamps in the home improvement stores, I have anyway. Find a auto parts store thats sell the Breeze brand hose clamps.

Bob,
Thanks for the info. I won't be able to install a tower or any other
large expense project at my QTH for the near future. The XYL isn't
too keen on our hobby and so the best I will be able to do is the pair
of Lindenblad antennas. I'm going with the Lindenblad antennas after
reading the section L.B. Cebik has on his extensive web site. Antenna
is omni-directional, has gain from 3 to 50 degrees, and I can build it
with simple hand tools. I'll start looking for more information about
the pre-amps on-line. I had looked at the AMSAT site, but they didn't
mention too many manufacturers for the pre-amps.
Thanks,
Rob Brown

Here in Israel, the Electric company is NOT allowed to sell Internet access. Planning for the day they will, they have laid fibre optic cables along all of their right of way. Currently they use it for their own internal data communications.

BPL will never be approved here. It was tested and found to cause interference. Here the IDF which is a combination of the Army, Navy, Air Force, Civil Defense, Department of Emergency Preparedness, Homeland Security, all rolled together takes a dim view of radio interference.

While we are a small country, they expect to be able to maintain communications using HF and low band VHF.

Geoff.

However the study was not intended to model an ideal elevated radial system, but one using an existing metal roof to serve as the "other conductor" of an electically short, vertical dipole.

The mesh wires used in the study to simulate the metal roof have a density of well below 1/10 wavelength, and for these conditions the roof would appear essentially solid to r-f.

A NEC-2 model of a 1/4-wave vertical monopole (base at earth level) in the AM broadcast band using just four, 1/4-wave radials elevated 12-15 feet above a perfect earth shows a peak h-plane gain within tenths of a decibel of the theoretical peak value for a 1/4-wave monopole over a perfect ground plane, ie, at least 5 dBi.

Such systems have been installed by commercial AM broadcast stations where the earth at the antenna site makes it impractical to use the standard 120 buried radials. These elevated radial systems permit those stations to produce at least the minimum groundwave field at 1 km for 1 kW of applied power that is required by the FCC for AM broadcast stations -- and with far fewer than "80-100...??" radials elevated less than 1/8-wave, fortunately.

Here is a link to a paper about this
http://www.nottltd.com/ElevatedRadialSystem.pdf

> Even if you equal the ground losses between the two, the

My models were done over a perfect ground plane in order to show the field of the monopole radiator as it is launched. This is the method used by the FCC in AM broadcast practice.

Terrain, obstructions, r-f ground loss, nearby parasitic radiators etc -- and in the case of ham antennas, their height above the earth -- will have an affect on system performance. But all of that needs to be evaluated separately for the installation conditions, based first on a knowledge of the field pattern launched by the radiator itself.

Rob,

As was pointed out, there are many options. Having been active on satellites for 20+ years, I would recommend that you look at the SSB Electronics units http://www.ssbusa.com/gaasfet.html and the ARR units http://www.advancedreceiver.com/page2.html in that order. If you took a poll of AMSAT members, I would be amazed if between the 2 they did not constitute 75% or more used. Both do well in high noise areas. The SSB units have some additional filtering, and adjustable gain.

While they are no longer sold in this country, if you come across a Landwehr unit, it would be worth considering. My 2 meter unit keeps on ticking 21 years later.

One thing to avoid is the units sold by major manufacturers such as Icom. They probably have some use, somewhere, but for satellite ops they soon get replaced as they have poor noise figures.

Finally, it is tempting to go with an RX-only unit. You will want the capability to both receive and transmit on both antennas, which pretty much means a switched unit, or some fancy relays. If you have short runs of high quality cable, you can probably get by on 2 meters with a unit in the shack. A mast mount is better, but for most things, one in the shack, with the above qualifications, is good enough. The 70 cm unit need to be mounted remotely.

Here in the USA we have manufactured "shortages" to manipulate the law of supply and demand. We have also let our antitrust laws become "trampled." Here, very large corporations manipulate the public as if they are children; these children have become very stupid and have no vision or common sense. To worsen matters, large corporations have bought our government officials and news media; the population is now fed lies, half-truths or simply no facts at all ...

We invented fiber optic cable, however, we will probably be the last in the world to have our whole country with easy access to it--it is not in the telcos best financial interests to see us all with dirt cheap internet access. However, some work against these large corps and attempt to find ways around their manipulations; BPL is but one example of this.

The 700Mhz freqs in question is/are a very good example of this, which is now playing out. Many wish to see these freqs cheap, with abundant access and choices of uses and out from under the direct manipulations of self-serving corporations/politics. However, this is not in the best financial interests of the "powers which be."

700Mhz (or, nationwide cheap fiber optics, for that matter) would be preferable to BPL, however, BPL has the possibility of being able to escape the large political/corporate controls; but, as you can see in the articles about 700Mhz, the billions are already being gotten together by the "evil empire" to buy your future and rent it to you at VERY inflated prices--here in the good 'ole USA ...

Your mileage, as well as your country, may vary ... Robin Hood rides in the form of BPL--sometimes; even Google can appear as the Dragon-Slayer in this sad Greek comedy/tragedy which plays before our eyes ... in America. :-(

Amateur Radio and its' importance just stands as a pale ghost in comparison to the dramatic figures in this play ... the amateur

community were warned--long ago; few paid attention--now it is too late.

Considering that BPL stands for 'Broadband over Power Line' how does
something implemented over the infrastructure of and thus controlled by
the power companies, you know, some of those large corporate entities
you say BPL will escape the control of, escape those large
political/corporate controls?

Shouldn't you really be asking:

1) How has this happened? (or, are we the "frog in the pan of boiling water?")

2) How can we stop our public servants (note: some refer to them as "leaders") from criminal, self-serving (pocket stuffing), anti-American and treasonous behavior and engaging in such conspiracies with large business?

3) How can we get real world figures/facts from our news media? And, why are these media outlets not on trial?

4) Etc., etc. ....

Power companies have already attempted to control "their" power-lines (really the public power-lines) from being subjected to a secondary use (BPL), they lost--so far ... American citizens can use their lines as they please. In the end game, I suspect the politicians will be paid off so power companies can hold BPL providers to ransom--this criminal behavior permeates government/business these days ... many are leaving the states, that is one option--let 'em tax the illegals to death.

This group is for antennas - so suggest you use
rec.radio.amateur.equipment news group.

News groups for Ham radio and their useage are listed at URL:
http://ac6v.com/newsgroups.htm

To answer your question about RIT useage on CW

RIT. Receiver Incremental Tuning (Clarifier on some rigs) allows you to
receive slightly above or below your transmit frequency. For DXing, it is
typically used for CW split pileups - set your main dial to 2 to 5 kHz up
from the DX station and use RIT to hear the DX station. This allows the DX
station to spread out the callers and prevents chaos on the DX frequency.

If an SSB DX station is operating with a small split, the RIT range may
allow you to use RIT to achieve the split. RIT typically covers +/- 5 kHz or
+/- 10 kHz and is frequently used for CW split operating, but not often in
an SSB split operation.

Another use for RIT is when you wish to transmit on a given frequency and
the station you are receiving is off frequency or drifts away or starts
chasing you by retuning as you tune on them. Rather than change the main
tuning dial (thus your transmit frequency) use RIT. The Main Tuning dial
determines the transmit frequency and the RIT determines the receive
frequency.

There are several good books that will explain DXing, operating, and
transceiver controls-- use google to search for Amateur Radio DX Books

Good Luck -- see you at rec.radio.amateur.equipment

Considering the efforts made and attention paid by ARRL on behalf of all
radio amateurs in the USA to stop BPL , the above seems rather off the
mark . In the end BPL will not come to fruition whatever the 'pushing'
by FCC and Commercial Powers , also because it will highly likely not
be commercially viable.

No. I meant a normal 6 1/2 0r 7' power saw with a thin grinding blade
or steel cutting blade. The cut width will be better than a hack saw
which I have found often to be to narrow as well as difficult to
control

I am afraid you missed the whole point, did you just "come on board?"

The surest way to implement the downfall of BPL would be to see the success of 700Mhz "freedom zone."

Then, BPL would pale in comparison to a method that can penetrate virtually any building and you can use while you walk down the street ...

Unfortunately, the mindset you have is shared by many, too many; unable to see the forest through the trees--you attempt to be the tail which wags the dog; while that may, or may not, work for high powers in high places--I believe such is doomed to failure--indeed, isn't that how we got here?

Message-ID: <demdnZ5r87utrCrbnZ2dnUVZ_ternZ2d@bright.net>
Source record: 37728

John's observations are useful. A dramatic example happened to me many years ago with a second story transmitter having a grounding wire that was as short as possible: with a change of frequency, the grounding wire became resonant and caused the transmitter to be very hot - I can still see the small scar tissue where I touched a knob. The short term cure was to run a longer grounding wire in parallel, which detuned the first wire.

If you use a reasonably balanced antenna (dipole, yagi, log-periodic, ...) it is unlikely that you will have a problem.

If you are to use a doublet fed with open-wire and fairly low power, an old Johnson Matchbox will be an ideal way to keep your transmitter happy.

Keep us posted. 73, Mac N8TT

No, I asked it that way because I know of no country besides the U.S. that tested BPL and allowed it, but in case there were any I was not aware of, anyone who knew could answer.

Do you know of any? The only country that came close that I know of was Austtrialia, because they have large sparsely populated areas. However last I heard it was canceled because it was shown to interfere with Coastal radio stations.

Because it is low power radio waves transmitted over very long wires.

Dear Frank (no call, France?):

Another choice is a log-periodic-dipole-array (LPDA). Several are
available that do a good job of covering 14 MHz to 30 MHz. One such
manufacturer is Tennadyne

http://www.tennadyne.com/specs&prices.htm

The link shows the specifications of most of their models.

LPDAs have no moving parts and everything is in a plane. If you purchase
one, I can offer a couple of very simple (almost no cost) enhancements.

As I recall, Tennadyne has a distributor in your area.

Hi Rob

Have you considered joining AMSAT? There is a wealth of information on
HAM satellites within that organization. I consider Bob's advice about
preamps to be excellent. AMSAT Journal, Volume 28 Number 4, July/August
2005 has a good article on preamps for HAM satellite reception.
Cebik's text on Lindenblads implies that it needs to be located only a few
feet above ground in order to realize the "omni-hemispheric" pattern, so
line loss isnt likely to be reason enough to use a preamp with it anyway.

My response was to Smith, not you.

176. Looking for advice on CAP/MARS antennas

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-06 16:52:28 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.06.16.52.26.877349@from.qrz.com>
Source record: 37590

I'm quite active in CAP and MARS and so I need to be able to operate on a fairly long list of frequencies between about 2.2 MHz and about 27 MHz (actually up to 24 MHz would probably be OK, not much goes on above there).

I'm looking for the best compromise antenna that will get me most of those frequencies with reasonable receive performance without a tuner, and SWRs under about 3:1 that my FT-1000's internal tuner can handle.

The plan is to program the frequencies of interest into my rig's memories and then scan across them, hence the need for reasonable receive performance with the tuner out of the circuit.

I'm aware of the B&W "radiating dummy load" (TTFD) antennas but I'm not quite ready to give up that much efficiency and I'm DEFINITELY not ready to blow $300 on one.

I don't mind putting up a multi-legged dipole array but I don't want to go overboard, and from my calculations (such as they are), I'd need a total of SIX (6!!!) dipoles all fed with a common feedline and operating on their fundamentals and third or fifth harmonics in order to stand any chance at all of covering it all.

I was thinking of maybe something like some variation of the G5RV, or the W5GI "Mystery Antenna" (http://www.w5gi.com), cut to an appropriate center frequency above or below the 20 meter band as needed, then maybe (MAYbe) I could get away with three of them.

Any thoughts?

177. Any homebrew auto-tuners?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-06 17:38:49 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.06.17.38.47.822977@from.qrz.com>
Source record: 37591

Are there any construction articles around anywhere that describe an auto-tuner similar to the LDG and SGC offerings?

I need an auto-tuner that I can control from a laptop, and set frequencies as needed (mostly for ALE). I can do the digital design and the software in my sleep, for an embedded microprocessor that can control all of that, but the heavy-lifting part of the antenna tuner (all the toroids and caps and relays) is a bit beyond my capabilities.

If there are any construction articles that I can adapt to my needs that would be a very big help.

Thanks...

hi

I dremel will work nice but you may want to build a small
jig to keep things aligned.

I would drill a small dia. hole at the bottom of the
place where your cut will end so it will prevent the
slot from continuing on and splitting the tubing.

good luck

tom

179. Jumpers across tower sections

Newsgroup: rec.radio.amateur.antenna

For lightning protection, is it generally considered good practice to install heavy-gauge copper wire jumpers across each junction point between tower sections?

My guess is that the electrical connection between one tower section and the next might be somewhat variable, especially if the tower sections weren't new when the tower was assembled.

No, it is not. Common commercial practice is to bond the base of each tower to a good common copper earth ground system around the radio vault structure... assuming the vault is close to the towers. ... otherwise, additional grounding would be needed around the towers' bases.

Best case scenario? Might help.

Worst case scenario? Can't hurt.

That said, could a corrosion condition arise from the "bonding" of
dissimilar metals? Would "tinning" the copper wire with solder
slow/prevent this possibility? Perhaps another fix ...

The original LDG tuner was described in a construction article in QST,
including a schematic. The SGC manuals have the schematic in them.

Practically speaking, it's just a bunch of relays. The hard part is
finding suitable relays. The LDG uses a L network with the capacitor
switched either to the input or output and inductors wound on toroid
cores. The SGC uses a pi network, and closewound air core inductors.

The values are in an approximate powers of two sequence (allowing for
standard values and the fact that you only get integer numbers of turns)
Capacitors in the AT11: 5,10,20,39,82,160,320,640 pF
Inductors in the AT11: 0.11, 0.22, 0.39, 0.59, 1.25, 2.5, 5, 10 uH

how much power are you going to run and what's the maximum mismatch?
that determines the size of the wire in the inductors and the
current/voltage ratings of the capacitors.
You also want to decide if you want latching or non-latching relays.
Most modern tuners use latching relays because after tuning, you want
power to be reduced to a minimum. For ALE, this might not be as big a deal.

Most modern tuners also implement some sort of frequency counter, which
is then used for a lookup table to find a previously set configuration.

Another key design aspect is that you probably want to shut down the
microprocessor after tuning, so that you don't have spurious signals
from the microprocessor clock. Either that, or choose a clock frequency
where the harmonics don't fall in *bad* places.

I've gone through the design and build exercise several times. Unless
you're doing it for the experience of designing an autotuner, I suspect

that buying a ready made tuner like the LDG AT200PC, which has a RS232 interface, is probably the cheapest and easiest solution. It has a published control protocol which is easy to work with (except that you need to be able to generate a pulse on RTS to wake it up...).

There was a two-part (I think) article in QST a couple of years ago
which showed a high-power external ATU with onboard microprocessor
control.

Its design was rather different from the LDG/SGC/Sunair/what-have-you
microprocessor-controlled switched-cap/inductor pi/L tuner. It
uses air-variable capacitors and a roller inductor (in a fairly
typical T-network). It doesn't implement automatic search-and-match.
Instead, it tunes from memory. You tune your radio to a specific
frequency, adjust the caps and inductor for the desired match using
up/down toggle switches, and then hit a "memorize" button, and the
controller remembers the frequency and the correct reactance settings.
On subsequent frequency changes, you just select the desired frequency
and the correct reactances are "dialed in".

Eliminating the "try lots of combinations to achieve the lowest SWR"
part of the system will greatly simplify the RF part of the
implementation... you won't need to implement the voltage and current
detectors, phase comparators, etc. needed to permit the digital logic
to measure SWR, etc. The on-board digital logic might be something as
simple as a micro which can [1] run a set of three stepper or gearhead
motors to rotate the cap and inductor shafts, and [2] read out DC
voltages from a set of potentiometers connected to the shafts.

A simple serial-port or USB protocol would then allow the PC to
determine the current settings of the reactances, and control the
motors to adjust them as needed for a new frequency. A second serial
or USB port would be used to communicate with whatever your rig is, to
either read out the frequencies being tuned, or to switch the rig to a
different frequency.

A similar system could be done with switched banks of inductors and caps, in the usual power-of-two size hierarchy. In this case, the micro would be just ordered to turn on or off the various relays used to switch toroids and caps in and out of the series and shunt circuits.

An automobile bumper jack works fairly well as a stake puller.

Excellent explaination of how to properly ground the base of your tower.
Too bad it doesnt address the question asked, which was the grounding
between tower segments.

> which is which.

The tricky thing is that the reflections will have a different effect on your reference antenna observations than on your Antenna Under Test (AUT) measurements (consider comparing a dipole to dipole, where you get a definite ground reflection, vs high gain dish to high gain dish)..

The way to handle this, if you've got time and inclination, is to scan one of the antennas in height. That is, set up your AUT (or reference dipole), then move the measurement probe vertically over a distance of several wavelengths, making measurements at several points. From this, you can calculate the effect of the ground reflection.

If you google: Ground Reflection Range Antenna Gain Measurement, you might turn up something useful. It's also described in Kraus's book.

You might also want to look up the "three antenna method" which allows you to get absolute measurements.

Good afternoon, Ed.

I am in the process of doing that, but my concern is that the second through fifth tower sections may or may not have a decent electrical connection to the first (lowest) tower section which is the one that's grounded.

This was an interesting approach (and I believe parts of it are sold as
a kit or assembled device, too). It would be a good approach for a
one-off, but if are going to do more than one of them, implying that you
need to get all the parts new (as opposed to scrounging surplus), it
gets pretty expensive pretty quick. (fiddling around to work out
mechanical details to use what's in your junk box and at the surplus
store is fine, when you build one.. gets pretty tedious if you want to
build 8)

It also might not tune fast enough for some ALE type applications or
have sufficient resolution.

Consider a switched relay scheme with 8 relays for L and 8 for C..
you've got 256 possible values. With a standard air variable C driven
by a motor, you'd need some sort of reduction gearing to get the ability
to set the plates to better than 1 degree accuracy. You could use a
stepper or a dc motor with an encoder, but you're still limited in the
speed at which you can go from one setting to another (I'd guess a

couple seconds... fast compared to cranking knobs yourself, slow compared to 10-20 milliseconds for a relay). The roller inductor has reduction gearing essentially built in, but, again, you're not going to be spinning it at 3600 RPM.. Probably more like 60 or 120 RPM (2 knob turns per second is pretty quick). Vacuum variables are more like the roller inductor (many turns to span the capacitance range). Jennings does life testing with 50-75% stroke at 200-300 rpm... at that speed, a cap that takes 10 turns from end to end could do 20-30 strokes per minute, or a complete stroke in 3 seconds or so.

An ordinary pot hooked to the shaft probably won't do as a feedback device. a) resolution issues, b) life... Typical panel pots have lives in the million moves range, which seems like a lot, until you do scanning 24/7 with a move every couple seconds.. say 20,000 moves/day will burn through a million moves in less than 2 months. Their resistance vs position will also change over life (you don't notice this on a volume control). There are feedback pots designed for this kind of duty that have much longer lives and have high quality resistive elements and wipers, but they aren't cheap. You'd probably want to use a shaft encoder (and incremental shaft encoders with 1000 pulses/rev are easy to come by).

Any way you look at it, there's a fair amount of electromechanical engineering that goes into making a reliable system like this (which is why the commercial units are fairly expensive..It's not just because they're connected to multi $100K plasma etchers.). In the classic antenna tuner case, it's a bit easier, because you don't need high quality initial position, just get close enough, and home in on the optimum setting for the match.

Which is essentially what something like the LDG AT200PC is..

Rick;

Don't sell the B&W antenna short. It is more than sufficient for most
CAP/MARS/Amateur communications. When configured as a NVIS antenna you
can reach almost everyone in your region. I have worked a distance
sufficient to cover the upper portion of the US east of the Mississippi.
Yes the efficiency of the B&W is not on a par with a tuned dipole
antenna but it offers the flexibility to cover all the CAP/MARS/Amateur
frequencies with out having to resort to an antenna tuner. Even then the
relative efficiency of the B&W when compared to an out of resonate
dipole is more than enough to compensate. This is why CAP/MARS/DOD use
the B&W for ALE communications.
If you insist in not using the B&W then a fan array of dipoles cut for
your frequencies of choice can be used. There is some interaction

between bands using this type of antenna which complicates the tuning of the various dipoles. Be ready for a lot of ups and downs during tuning. There is no best antenna for anything. The standard to which the relative efficiency virtually all antenna are compared to is the dipole. What ever you do it isn't wrong,just different.

Dave Nagel
RF 143
WD9BDZ

BTW: I believe the current cost for a B&W 160-6 non stainless steel antenna is about $225US from most sources.

Fairly well? It works great! Pulls out a 10 foot ground
rod like it was set in butter. The big thing is that once
you've lifted the ground rod a foot or so, you can pretty well
pull it out by hand. I just wish there was some way to
jack it in!!

That's the stepper motor controlled one.. Note that he used a switch to switch between fixed inductors rather than a roller inductor. Also note the comment about 3 months of evenings and weekends to build it.

Also helps to have a 2' sheet of plywood with a 4" hole in the middle
that you can set on the ground around the stake to set the jack base on.
In goopy soil, you can drive the base of the jack into the muck before
you get the rod out.

Can't beat instanteous good enough match.. and the loss is on the order
of 6dB (see Cebik's webpage on T2FDs). pretty darn simple and screwup
proof.

> If you insist in not using the B&W then a fan array of dipoles cut for
> your frequencies of choice can be used. There is some interaction

some interaction? You're going to go insane trying to tune this,
particularly in a field installation if there's any wind blowing to
change the relative positions of the wires and any surrounding stuff. 3
wires works ok to cover 10,15,20,40 and can be tuned reasonably well in
10-15 minutes if you have some sort of antenna analyzer that lets you
sweep it to find the resonances.

> between bands using this type of antenna which complicates the tuning of

And, it would be quite straightforward to build one yourself, if you
have time and materials available. Look up B&W's patent at
http://www.uspto.gov/ for complete construction details. (I think the
patent number is on the B&W website) The patent is expired, by the way,
so you're not infringing to build one. Probably the only hard thing to
come by might be the big resistor, but that can be improvised in many,
many ways. (blocks of charcoal, pipes with salt water, etc.)

Hi all,
I looked at this site and don't see a dimension for the loops,
Ok maybe not an error, but shouldn't the loops have a specific
physical length. Please see the antenna at;

http://martybugs.net/wireless/collinear.cgi

Why not make a duplicate tuner of that which is in your radio now
except use
higher power units. You should be able to control this unit using the
existing
circuitry in the radio. Actually a purchased toroid transformer with
several taps would
probably the quickest way to go using a multipole switch.

Good points!

A couple of years ago, I was at a local hamfest/fleamarket, digging through a big pile of relatively-new-looking industrial surplus. I came across a nice air-variable capacitor, and asked the seller for a price... got it for around $5, I think. He then said "Oh, if you like those, I think there's one of them inside one of these things... that one there." Metal case, N connector on one side, high-voltage connector on the other, and a DB-25 for some sort of control connection.

I offered him $15 and he accepted.

After looking at it for a while, and doing some research, I've concluded that it's just what you indicate - a matching unit for a single-frequency RF plasma-etching system. It has what appears to be a fairly spiffy SWR detector, and then an L-match network designed to match a 50-ohm (I assume) RF feed to a lower-impedance load having some amount of reactance. The shunt element is an air-variable cap. The series element is another air-variable cap, in series with a hefty silver-plated coil which feeds the high-voltage connector. These are big cheese-cutter caps with widely-spaced plates. I get the feeling that this matcher was handling quite a lot of power.

Both air-variable caps are turned via geared-down DC motors, and have position-sensing pots. The motors, pots, and SWR detector are all hooked to the DB-25, and I assume that in normal operation there was a control console of some sort at the other end of the cable which had the necessary control logic.

I haven't been able out a way to make real use of it yet, but it's a glorious beast to look at, and I don't think I want to know what it probably cost when it was new.

As to the original query - I suspect that an important part of the practical engineering of an ATU of this sort, is enabling the digital logic to co-exist well with the RF. Not only do you need to keep birdies from the micro out of the RF path (by e.g. idling the processor when not tuning), you also have to keep induced RF on the control and sensing lines from sneaking into the digital logic and causing it to either malfunction, crash entirely, or spew Magic Blue Smoke out of its poor little fried-CMOS brains :-)

If slots 180° apart clamps it fine, you're done. If not, more slots or
widening of the two slots are in order.

According to that link, the loops are 10mm in diameter, or 10*pi mm around.

Yes - as I learned stainless steel worm-drive hose clamps are *the* way to go. All have a SS band... the cheap ones have a steel screw... the better ones have a SS screw. If you can't find 'em locally, McMaster-Carr (http://www.mcmaster.com/) handles them in more variations than you can think of! Hint: a dab of antiseize compound on the screw threads will keep the screw from galling on the band (and ruining your day).

I used one for a few years with great success on all bands 80 thru 10.
Don't let the old 'dummy load' stories throw you. You can build one
easily -- there are lots of plans -- just google it as T2FD.

If I were to spend $300 , I'd rather put it into a decent tuner,
rather than antenna.
Then you could run a single ladder line fed dipole, if a one
wire solution was better.. Also use it with any other antennas
you might mess with.
I'd never pay $300 for one of those antennas, but heck, I wouldn't
pay $300 for any antenna... It's against my religion.
Actually I was too cheap to even pay $300 for a tuner. I got a coil
form
damaged 989c free, and repaired it. :/
I don't use it much, but it's handy to have around.. Can feed about
anything, including ladder line.. It uses a balun, but I haven't
really
had any real trouble with it as far as noticable balance problems.
Some other tuners might be a bit better though if balance is critical.

>
> I don't mind putting up a multi-legged dipole array but I don't want to go

> of SIX (6!!!) dipoles all fed with a common feedline and operating on
> their fundamentals and third or fifth harmonics in order to stand any
> chance at all of covering it all.

Knowing me, thats probably what I would run. Tuning wouldn't be that
big a deal if all the legs are spread out as far apart as possible.
But if you closely stack them, tuning can be a hassle..
But the attraction of this system is that is not really much of a
compromise as far as efficiency is concerned. And instant
QSY too. I'd only bother with the bands I'd know I'd use.
When I was in AF mars back in a previous life, we only used
two freq's for the most part.. Sure they had others listed, but
rarely
used. BTW, yes you can make use of a few other resonant points
that will pop up.. Many will be able to be matched with the radio
tuner. IE: 7mhz can do 21mhz, etc.. Your radio tuner will be pretty
much acting as a line flattener, so the tuning could be off a bit and
still

work ok.

>

Dunno. I'll have to ponder that a while.. But something doesn't seem
right to
me.. My red flag is going off.. By "perfect ground plane", I assume
you mean
120 radials? I have a hard time seeing 4 low elevated radials within 1
db
of 120 buried radials over real ground. I realize the ratio should be
equal
if converted to "perfect ground" but still, this just doesn't seem
right to me.
I know I've never seen results like that here on real earth. I've
tried four
slightly elevated radials quite a few times on 160m, and I've never
had the
illusion of performance nearly equaling 120 on the ground.
In fact, I've heard of a few others that complained how lousy that
type
of system worked overall, and went to many more buried radials with
better results.
Lets say the two were over poor earth. I would think the 120 radial
system would still be pretty low loss, but the 4 radial system quite
stunted
in comparison. I have a hard time seeing them within a few tenths of a
db
of each other. I dunno if I trust that particular modeling... :/

On older models of Carolina Windoms, the line isolator was simply a piece of RG-8x coax, with one end wrapped around a ferrite rod (and housed inside a piece of PVC).

If you do away with the line isolator and hook your coax directly to the balun (I think they use a 4:1), you should receive signals just like any other dipole. If you do not, I'd say the balun is bad. If you do, then the line isolator is bad.

If this is a new antenna from Radio Works, they will probably make it good. If it's a used antenna you can try to fix it yourself. Take a hacksaw to the PVC and get it apart. You may find a broken or unsoldered wire. You will need some new PVC caps, pipe, glue and such to make new housings, but that shouldn't be difficult.

>
>I attatched a 20m run of coax to the line isolator. When I switch on the rig I get nothing, even on strong BC stations.
I assumed it was a coax prob and striped my plugs down etc. I then discovered that if the shielding was not touching the socket on the rig I got a very good signal. So I assumed there was a short in the coax. I checked the plugs and they seem fine but I note that even when I have just the co-ax plugged in (ie no windom) I get a good signal unless the shielding is connected. (I guess that would make sense though I thought the shielding stopped the centre core picking up a signal.
>
>So where is my problem? Is it the antenna? Is it the ine isolator. (There is no indicator which way round it goes so
I presume it is universal.) I have no tset equipment as yet so an easy solution would be valuable.

I think you need to rethink this. A T2FD antenna is a radiating dummy load on frequencies that it is not really cut for. A squashed rombic is more accurate. On frequencies near resonance it is mostly antenna, as the resonance drops it becomes an oddly shaped feedline with a dummy load on the end.

The T2FD was developed by the U.S. Navy and is a popular millitary and government antenna. The B&W one is designed for that market, you can make one very easily from copper wire, strips of insulating material and some resistors. The requirement for the resistor is that it be around 600 ohms and non resonant, so depending upon exactly what you transmit with, and how you transmit, the power requirment may be less than you think.

The resisitor must be able to withstand the peak power and the average power. Carbon resistors tend to withstand much higher peaks for very short times than they are rated. Average power is often far less than peak, for example while AM and RTTY will heat the resistors far more than other modes, CW and SSB will not. One figure I read was 12%.

One book, I have is Practical Wire Antennas, by John Heys, which discusses it in simple, easy to make terms. The book seems to out of print, replaced by Practical Wire Antennas 2 ISBN 1-905086-04-0.

I think it came from his book, but I remember a high power resistor made from a combination of low power resistors in a series parallel form.

I'm sure you could build one for far less than $300, most of the money going to the resistor and if you decided to buy one, a 9:1 balun.

Geoff.

All I can say is, I was on a CAP HF net a while ago with another station about 10 miles away from here, and we were both working another station about 125 miles north. I was running 5 watts to a cut dipole at 17 feet, and the 10-mile-away station was running 100 watts to a B&W at 25 feet. The faraway station reported that my signal was stronger than his by a comfortable margin.

This morning I was on the same net with the same 10-mile-away station, working another station about 90 miles away. He reported the faraway station as weak but readable, and I was receiving it loud and clear, about 10 over S9.

I realize there are MANY other variables that could account for this and the only real proof will be if I set a T2FD up here and compare them side by side... still, the difference in signal reports is impressive and more than I expected.

212. What is an Explorer Tower?

Newsgroup: rec.radio.amateur.antenna

Source record: 37626

I have a chance to buy an Explorer 40-foot telescoping tower, which from the very brief description I have sounds like it might be useful for Field Day and CAP exercises, but I can't find anything on the net that describes it.

It comes with something called an "undertire" mount, which I assume means a tower base with a plate onto which you drive the tire of a vehicle and park it there, to hold it down.

I googled "Explorer tower" and got nothing. The owner reports he bought it from AES but there isn't anything about it on AES's website either.

Anybody know what it might be and where on the net I might be able to find some information on it?

Thanks...

> I assume you mean 120 radials?

No, this assumes that the earth is an infinite, flat, perfect conductor -- in which case no radials are needed for a monopole radiator to reach its theoretical performance. But careful measurements done by Brown, Lewis and Epstein in 1937 in New Jersy (conductivity 4 mS/m or less) show that a 1/4-wave monopole using113 buried radials about 0.41 wavelengths each will produce a groundwave field that is within a few percent of that when using a perfect ground.

A 1/4-wave monopole using such a perfect ground has a peak h-plane gain of 5.15 dBi, and will generate a groundwave field of about 314 mV/m at 1 km with 1 kW of applied power.

As a point of calibration, the FCC requires Class B regional AM stations to generate a groundwave r.m.s. field of at least 282 mV/m for 1 kW at 1 km. Using 120 each 1/4-wave buried radials with a 1/4-wave (or somewhat shorter) monopole can do that for almost all real ground conditions.

Class A (50 kW full time) AM stations need to generate at least 362 mV/m r.m.s. for 1 kW at 1 km -- which means they must use a radiator longer than 1/4-wave. Most of them use 195-degree radiators.

> I have a hard time seeing 4 low elevated radials within 1 db
> of 120 buried radials over real ground.

Understandable, but when properly done this is the case, as described in the paper I linked to earlier. Buried radials behave much differently than elevated ones. NEC models also show this.

It would be tough to find a tuner that can handle hundreds of watts,
tune in milliseconds, and cost less than $300..

The original poster was talking about *automatic* link establishment,
which implies hands-off operation. The T2FD antennas do that quite
nicely. You're not looking to dig out faint DX from a pileup here, but
establish a link on a designated channel. If the 6-10 dB hit is too
much, you look for a channel where propagation is better.

But so what... in ham terms, an antenna that radiates 25% of its
feedline power would be considered egregiously inefficient, but hey,
that's only a 6dB hit. Easy to make it up with an amplifier on Tx, and
on Rx, you're usually external noise limited anyway, so, from a system
standpoint, the T2FD isn't a bad approach.

Exactly... but don't expect it to stand up to much wind load
40 foot lever arm on a 1 foot plate, and it's pretty easy to lift the
tire off the ground.

I've found that some form of tripod and some shot/sand/water bags is an
easier field expedient (because you can put it anywhere... you don't
have to be right next to the car).

Thanks, Dave
So 10mm*pi is equal to about 1/4 wavelength at 2.437Ghz. I have
spent
about twenty minutes with google and I don't find any info saying that is
the proper
length to phase the sections. What do you think?
Mike

Hi Rick,

The difference is called propagation, and you have the advantage of
being in line-of-sight. Even a Christmas tree bulb can communicate
that far at those antenna heights.

Hi Mike

If you wanted -- you could replace the "loops" with quarterwave stubs to
separate successive halfwave radiators.

Jerry

There are no doubt multiple ways to construct such an antenna. A simple approach would be to use halfwave-long vertical radiating sections, and shorted quarter-wavelength stubs (sticking out to the side, or curled into a near-circular shape) as phasing sections. This would result in "stacked" half-wave radiators. The "Super J-pole" uses this approach.

Another approach for collinears is to use 1/2-wave or 5/8-wave radiating sections, and lumped inductors as phasing sections. An example of this is the Hustler G7-144 (three stacked 5/8 radiators, with lumped inductors between them).

I haven't gone over the design that you posted in detail, but it wouldn't surprise me greatly if the main radiating sections were around 5/8 wavelength, and the phasing loops have enough inductance to create the appropriate phase relationships. Since the phasing sections are inductive loops rather than shorted transmission lines, one would not necessarily expect the "radiating section length, plus total length of wire in the phasing section" to add up to precisely 1 wavelength.

Jim,

Thanks for the leads. I will consider them. I'm also thinking of taking a few distance measurements to see if they look like they fit the far field 1/r*r criteria. If the measurements are too far off, then I'll assume I've got a bad test criteria, and I'll rethink the whole shebang.

Gad, just what we need is more existential fodder for Arthur (except
you leaped to an antenna connection before he could opine "throw away
the text books").

Future nano antennas? At this scale, there is nothing so amusing as
those in, over their heads. It may shock many to discover that
resonance becomes decoupled from scaling at this -um- scale. This
isn't your dad's quarterwave monopole anymore.

Another message from Western Union, the Casimir effect was well known
CENTURIES ago to sailors. It was only myopic scientists who
re-discovered it under their microscope and put a label to it in spite
of this common knowledge.

Good afternoon, Richard.

I guess I wasn't clear. Stations A (me) and B are 10 miles apart.
Station C is 90 miles from both stations A and B, broadside to a line
between stations A and B. Station A runs a cut dipole at 17 feet and
Station B runs a B&W at 25 feet. Station C comes in weak at Station B
(with the B&W) but strong at Station A (with the cut dipole).

I suppose that propagation between Stations C and A will be different than
between C and B, but usually not that different...

Actually I was planning to use it with my motorhome, under the rear tire... good luck getting THAT tire up off the ground.

Still need some info on the tower / mast, though... unfortunately the owner is 120 miles away from here so I can't just drive up there and take a look...

That's the other way... make measurements at the same heights, but
moving the antennas apart... overall, you know it has to be a 1/r^2
relation, so you can fit a straight line to the bumps.

One might think so at first glance, but here goes with a short scenario (I was looking at using the roof rack on my car to stabilize a portable mast)..
http://home.earthlink.net/~w6rmk/antenna/mastcar.htm has details..

40 ft mast 2" in diameter in a 80 mi/hr wind has a moment of 2200 ft lb. if the distance from fulcrum to tire is 1 foot, then the up force on the tire is 2200 lb.

So, your RV won't be lifted up, but my 3000 lb car would.

And, of course, if it's only a 40 mi/hr wind the load is 1/4, etc.

In practice, most people use a fairly lightweight mast and let it fail before it damages the car.

So? Your claim is the Casimir Effect only has domain over atomic sized particles and "possibly" larger? Interesting, I would take your bet ... if it affects atomic sized particles, it will be found to affect smaller; and bigger, I wonder? But, apparently, that/those questions are being posed ...

>Well, did they claim to have levitated atomic sized particles?

Talk about the claims of Tritonic minnows.

The Casimir effect is a specious example of a larger effect. Centuries
ago (and even now, if anyone cares to attempt it), when ships are
side-by-side, in close proximity, a difference in energy level
pressing on the ship's hulls is found to draw them together into
collision.

For others: The wave energy in the sea comes in many wavelengths and
is equally distributed upon the surface of a large ship (no appeals to
nanotechnology is required to understand any of this). As a result,
the combined force is washed out, so to speak. The net force of all
energies does not otherwise move nor change the course of a ship.
However, when two ships are running parallel tracks close together,
the space between them limits the frequency of wavelengths between
them. There is thus a smaller range of energies present between the
ships. The balance in energies applied to all sides of either ship is
lost. That loss is found in the parallel faces of the hulls and the
remaining original forces cause the ships to draw together and
collide.

Now, what has this got to do with nanotechnology? NADA.

What has this got to do with antennas? NADA.

What sort of lens would reverse this effect in ships to push them
apart (so called levitation of the Super Man comix)? The reader can
rest well to imagine another shaggy dog proposal.

Nice fairytale; and given all the time at sea, those sailors certainly would have had the time to dream it up; and, it is easy for one to imagine as holding water.

However, the rising and falling of the ships would create a "pumping effect" between the said ships ...

As, the ships rise on the wave, the ships tend to be "pushed" together by the fact that water on all the outsides of the ships finds it easier to flow up to, and onto, the ships, leaving a "partial vacuum" in between the ships due to the fact water "flowing in" between the ships faces more resistance getting in their.

Now, as the wave subsides, the ships are "held together" by the fact the water "flowing out" between the ships faces much more resistance than the water flowing away on the outsides ... the ships eventually end up touching.

While the Casimir Effect may, or may not, relate to this phenomenon in some esoteric and abstract way--I rather doubt it! <silly grin>

QUIT PULLING RICHARD! I FEEL MY ONE LEG, YOU ARE PULLING, GETTING LONGER ALREADY. :-)

Nah, the old methods are the best.
1. Attach antenna wire to gecko.
2. Get your gecko to climb as high as needed.
3. Key up with a kilowatt.
4. Antenna is now secured with lossy carbon resistor for a lovely wide
bandwidth.
Simple.

Geckos have had sticky but dirt resistant feet for millennia. There was an announcement over a year ago that some new plastic compound had been developed to duplicate the effect. It all relies on the attraction between closely spaced molecules. I guess someone needed to find a method of peeling it off after it had stuck firmly. Applying an electromagnetic field in the correct manner would break the atomic level attraction between the materials. Don't know how the geckos do it though. Maybe they have a charge generator like an electric eel?

Yeah thats always bad. I chose my XYL to fit in with my hobby <grin>

Of course height isn't as important for sat work than it is for terrestrial. You can place small directive arrays on the rooftop and steer them easily. I realize you are already Lindenblad bound but 2-3 element quads or helix antennas are still quite unobtrusive. Another possibility is the egg beater type construction that with a simple azimuth rotator will give you a few more dB gain than the "full" omni. I personally went from a cross dipole to a Lindenblad in my first satellite experiments with RS10. Was only running 3W SSB on 2m and it was copyable on 10m down to 5 degrees elevation.

But back on the preamp front. I saw Alan's recommendation for the SSB Electronics unit. No doubt there is a good reason for such a "high" price, but I think I'd stick to building one from cheapish dual gate FETs. Granted the NF isn't as low but with average rigs running 4-12dB the improvement will still be significant. (Some rigs benefit from changing PIN diode T/R switching to a coaxial relay. It really is surprising) You may even want to do the maths of determining how much RX signal you really need. A satellite is of course listening for signals against a large amount of terrestrial noise whereas you are looking up at essentially a cold RF sky. One of the reasons now doubt for the disparity in ground station vs satellite RF output power.

Down East Microwave do a number of LNA's;

http://www.downeastmicrowave.com
and a 2m device;
http://www.downeastmicrowave.com/PDF/2mlna.PDF

I remember hearing good things about the company maybe 10 years ago.
They are a around $30-60 for RX only applications.

Sorry I ran out of time web searching. They aren't as prolific as I thought!

I apologize for waffling!

Cheers Bob

Hi Rick,

Some years ago, I fabricated a 40' tiltup/rotatable mast from common 1" plumbing pipe specifically for FD. Yes, it needs to be guyed (two guysets). The mast supports a Cushcraft A3S 20/15/10m yagi. The top guys serve double-duty as 80 & 40m inverted vees (80m is a 4-wire cage, and covers nearly the entire band w/o a tuner).

Some metal fabrication is required (drilling & light welding) but it's not too involved. A single person can assemble & tilt the mast up/down though more hands makes it go faster. Some photos and a video clip are here: http://tinyurl.com/38v9wn (the video clip is the last thumbnail image). Let me know if you need more info.

Ah, but "A" is me, and my dipole is cut for the frequency ... no tuner involved. The 10-mile-away station with the B&W also has no tuner. So, tuners don't enter into the picture for this particular test.

If that is a dumb question, that makes two dumb people we have found,
you and I.

I finally settled on a vinyl spray paint, the type found in auto stores
to "restore" vinyl dash boards from the effect of solar rays. I could
find no metal compounds on the list of ingredients and took a chance.
Seems to work just fine. Balun is in an enclosure which keeps most
moisture out, condensation is my major worry.

If I ran high power into the balun--running a high swr, I would begin to
worry about the heat tolerance of the vinyl spray (wire insulation is
high temp enamel.)

I am glad you posed this question, others might have better methods, I
have never thought to ask.

You often use powdered iron when you need high Q in an inductor. Water between turns can seriously degrade the Q. Painting with enamel might lower the Q somewhat, but nowhere near as much as water. To maintain the best Q, you need to keep water well away (say, a couple of times the turn spacing) from the wires. No physical harm will come to the core from being outside in the weather.

My reading of the Polyphaser technical papers is that bonding between
sections is not done for many of the reasons already mentioned.

> My guess is that the electrical connection between one tower section and
> the next might be somewhat variable, especially if the tower sections
> weren't new when the tower was assembled.

So long as the galvanized metal surfaces are clean when assembled, there
should be adequate bonding between the two.

The principle miscreant amongst the few "actors" is Mark Morgan, KB9RQZ,
himself. When flooding the Amateur radio groups with hundreds of daily
nonsense posts, can you be at all surprised that more than a few of the
other Usenet Hams become angry?
Mr. Morgan, of Chassell, Michigan, has single-handedly turned the radio
newsgroups into cesspools while myopically claiming that he is the "victum"
and is defending his non-existent "honor".
During Mr. Morgan's forced absence a few days ago while Tera News was down,
the groups returned to their relatively normal, peaceful state. That alone
is all the barometer one needs on this topic.

Here's a link to an old Boonton paper
that describes measurement of inductor Q
at 400 MHz (see page 3) when the
inductor is immersed in tap water. In
Boonton's experiment, no appreciable
effect on Q was noted, except when NaCl
was added to the water. ;-)

Is the greater effect of water on a
powdered iron inductor caused by the
much higher permeability of the iron
than of the air-wound coil Boonton used?

Anyway, it's an interesting paper.

253. Vertical Whip Antennas And Gain Question ?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-08 16:07:27 UTC
From: Robert11 <rgsros@notme.com>
Message-ID: <182dnXhbBO9JdCTbnZ2dnUVZ_jydnZ2d@comcast.com>
Source record: 37567

Hello,

Am a real novice when it comes to antenna theory, but am trying to learn. if anyone could explain the following for me, even though I admit it's really awfully basic, would be most appreciative.

Am interested in receiving only, around the Marine VHF bands of 156 MHz, or so.

I understand that "Gain" is achieved in many antenna configurations by making them very directional.
My understanding is that you in effect re-shape the lobes to be prominent along one axis, and minimal at right angles.

So, how is Gain achieved in a
vertical whip (the specs usually mention 3 or even 6 db), or the rubber-duckie, types of antennas used so often on handheld scanners (or mounted to recreational boats) ? They are, I believe, truly omni directional.

Also, are there vertical whip antennas that are directional, with "gain" perhaps ?

Thanks,
Bob

for miniaturizing wi fi wi max or any band in the 100 MC to 10GC range,
You can use FWT antennas. FWT(Focused Wave antennas) miniaturize and
ruggedize antennas by embedding them into an engineered dielectric, when
hardened becomes and integral part of the antenna. For the real high
gain antennas, the mechanical support for the extra eleemtns is provided
by the intirinisic design of FWT antennas. Built in Balun and have
begun to integrate electronic onto he body of the fwt antenna. this
eliminates the rf connector, looses and performance degradation that
occurs right at the antenna to first stage interconnection!

>vertical whip (the specs usually mention 3 or even 6 db),

Hi Bob,

This is usually achieved through co-linear elements. That is, one
vertical element stacked upon (above) the other, inline. Many such
"gain" antennas' details of construction are obscured by a fiberglass
shell.

>or the
>rubber-duckie, types of antennas used so often on handheld scanners (or
>mounted to recreational boats) ? They are, I believe, truly omni
>directional.

Quite so. Unfortunately there is more to "gain" (or effective
sensitivity) than co-linear elements at the frequencies you are
interested in. More important is height which can make a substantial
difference in perceived "gain." If you invest any of your interest in
raising an antenna, it would reward you to also hoist a co-linear
design instead of a rubber duckie.

>Also, are there vertical whip antennas that are directional, with "gain"
>perhaps ?

As stated, the co-linears. They are common.

Now, as to the need for gain. The marine band is principally limited
to line-of-sight transmissions - hence the advice for height. The
higher you are, the further you can see. The earth's horizon can be
expressed as being the square root (twice the height in feet) miles
away. So, if you are using a rubber duckie, that horizon would be
roughly 3.5 miles away (barring obstructions). If you hoisted it 30
feet in the air, the horizon would be about 8 miles away, and less
likely to be obstructed (except at the far end). If your 30 foot
antenna is listening to a ship's antenna at 30 feet, your greatest
range would be roughly 16 miles. An airplane at 30,000 feet would
stay within your range out to 245 miles.

Without obstructions, you could probably hear them (airplanes or
ships) quite clearly even if they transmitted only 100mW of power.
Gain would be unnecessary.

However, we can anticipate variables to this such as those neglected obstructions, and what would be called propagation. The signal becomes weaker by degrees, or by huge plunges. Some of this can be made up for by more power by the transmitter, or more gain in either/both antennas.

That's correct. However, it's important to realize that the antenna
pattern is three-dimensional, not two-dimensional.

Antenna (directional) gain is achieved by (in effect) shaping or
compressing the lobes on both the vertical and horizontal axes.

>So, how is Gain achieved in a
>vertical whip (the specs usually mention 3 or even 6 db), or the
>rubber-duckie, types of antennas used so often on handheld scanners (or
>mounted to recreational boats) ? They are, I believe, truly omni
>directional.

They are omnidirectional in the plane which is perpendicular to the
length of the antenna. That is to say, they have the same gain or
sensitivity "on the horizon", no matter which compass direction you're
looking in.

They are *not* omnidirectional in elevation.

The gain pattern of a vertical whip looks something like a donut. The
pattern shows the greatest sensitivity in the direction of the
horizon. At angles above or below the horizon, the sensitivity
becomes less and less. A theoretically-perfect vertical antenna, in
free space, has an extremely deep "null" in the direction along its
axis... it's very insensitive to signals arriving from overhead or
below.

The way that a vertical antenna achives gain, is to compress the
"donut" pattern vertically. Compared to a standard reference dipole,
such a "gain vertical" is more sensitive in the direction of the
horizon, and for some number of degrees above and below the horizon.
Once you reach a certain elevation, the gain antenna's sensitivity drops
down to the point at which it's equal to a reference dipole... and at
higher elevation angles, it's _less_ sensitive than a reference dipole.

The word "omnidirectional" can be a bit confusing, as to a beginner this can convey the idea that the antenna radiates equal power in all directions of the sphere (and has equal receive sensitivity in all directions). That isn't the actual meaning of the term, when discussing antennas.

An antenna which does have equal sensitivy in all directions of the sphere is an "isotropic" antenna. The sensitivity / gain of an isotropic antenna is often used as a reference point for measuring or describing other antennas... if you see antenna sensitivity referred to in "dBi", you know that this is the type of reference being given.

Isotropic antennas don't (and can't) actually exist in practice... the EM field equations don't work out. It's just a convenient theoretical reference.

The other antenna gain figure you'll see is "gain, as compared to a reference half-wave dipole". This is denoted by "dBd".

For any given antenna, its gain dBi will be 2.15 dB higher than its gain in dBd (in other words, a reference half-wave dipole has a gain of 2.15 dBi or 0 dBd).

When you look at antenna descriptions or ads, make sure you know which reference is being used. Antenna manufacturers sometimes like to simply say "dB" without saying which reference... and in this case it's likely to be dBi, because it makes the gain number larger and makes the ad read better :-)

>Also, are there vertical whip antennas that are directional, with "gain"
>perhaps ?

A single vertical antenna, with no other active or parasitic element, is going to have the same pattern in every direction towards the horizon. It's rotationally symmetrical, and therefore its sensitivity pattern is also symmetrical around the vertical axis.

If you want greater sensitivity in one direction, you either need a second element, or you need to bend the antenna somehow so that it is no longer symmetrical around the vertical axis.

Gain is commonly referenced to "isotropic" or pure omnidirectional
radiation. Even without using collinear elements, there's gain in a
vertical whip, just as there is in a horizontal dipole. In fact, even
an "omnidirectional" antenna operated over a ground plane has gain,
because of the reflection from the ground plane -- the surface of the
water for a marine antenna. At the very least, the energy radiated is
confined to half a sphere instead of a whole sphere.

You can download the EZNec demo program and look at, for example, a
half wave vertical dipole in freespace--just open the dipole1.ez file
(which has 2.16dB gain over isotropic), and a vertical quarter wave
fed against an infinite ground plane (which has gain over a dipole in
freespace; 3dB gain if the ground is infinitely conducting, since the
pattern is exactly half the dipole pattern, and all the power is in
that pattern, thus twice the power per unit area at a distance).
However, ground loss will kill much if not all the gain of a vertical
operated against real ground; but that may not be reported by the
antenna manufacturer, since the loss is not in the antenna itself (and

of course the numbers look better if they don't include the ground loss, inevitable though it may be). You'll see a much different effect if you simulate a vertical dipole spaced a few wavelengths above ground, be it a perfect or imperfect ground.

Vertical collinears operate by having several vertical elements radiating generally in phase, so in the horizontal plane, you the reinforcement of all of them, but as you go up or down from horizontal, the phases no longer match (it's further to an element at one end than at the other). So you get a "flat pancake" effect. You can adjust the design so the phases are not all the same, but progress uniformly along the antenna, causing a cone-shaped pattern, useful for an antenna on a high mountain, for example.

Making an antenna have purely omnidirectional radiation, even in freespace, is extremely difficult. So in that sense, pretty much all antennas have patterns which have "gain" over the theoretical omnidirectional. System losses may negate that gain, but the pattern at least will show some directionality.

Cheers,
Tom

Bob,
First of all we have to determine what your needs are before we talk
about antennas.
For instance, you state it is for listenning purposes only, very
important, and then you state
it is for listening to a marine band. It is here where your physical
position is important.
If you are on board a ship you might want to hear everything around,
all directions. If you are on shore then you probably
do not want to hear anything behind you and concentrate on a beam form
of antenna. The antennas for these two different situations are quite
different so this is a descision you must make before deciding on the
antenna.

I too vote for this mthod. Once manufactured a lot of antennas as a club
project and we made a jig that fit the band swa. Just stick the tube in the
hole and pull it out. Also tubing for the antenna was placed in a jig and
all the pieces were cutto length with one pass of a radial arm saw.

Hmmm, from the others answers, I suspect they all have only dealt with cores which have come coated with some protective coating (paint, enamel, etc.)

I took it for granted you were speaking of the ones which can be cheaply obtained, at times, which have not passed specs but are completely usable; however, the manufacturer neglected to coat them ... without coating the core shows oxidation damage with time.

In addition to Richard's words.

One thing to also keep in mind is that once you reach the maximum range of a "lower" gain system, changing to a higher (antenna) gain system doesn't realize a huge increase in coverage. (Ignoring the gain effects of height that is)

The theory of course says that if you have 6dB more gain you will cover twice the distance, simple inverse square law stuff. What happens though is once you are at maximum distance with the lower gain system, the path losses past that point are much higher than what you get from simple inverse square law. I forget the actual numbers now but whilst still in line of sight of the antenna (and a little more) you'll get roughly the 6dB loss for every distance doubling. Past LOS and out to some distance (500km?) you lose a huge amount more, maybe 30dB per distance doubling. After 500km the loss curve is steeper still. I'll admit I cant remember the numbers nor the distances well but you can see that once past LOS, where you will be at maximum low gain coverage, an extra few dB of antenna gain wont make a lot of difference. (You can model this if it is important to know)

The best analogy I ever heard of for describing antenna gain was those foam rubber stress balls. In its spherical state it represented a point source radiator. As you squash down on the ball, it becomes more like a pattern for a normal dipole . ie the diameter in the horizontal gets larger. Higher and higher collinear gain is represented by pushing down harder on the ball still. You could eventually make it into a very thin pancake with a large diameter (and be very stress relieved!). You can also see from this analogy that in its spherical state a lot of radiation also goes up and down, where it isn't much use normally. As it flattens you get less and less up or down angle radiation. There is a downside to that for example when you are skating up and down waves, your pattern is skying one side and burying in the water in the other. It sometimes pays to not have a too high gain collinear on a boat for that reason.

Hope you find this useful.

BOB W5/VK2YQA

Out of curiosity, I immersed a 37 uH
inductor wound on an FT37-43 core in tap
water. Using a (1 kHz) inductance meter,
I saw no change in inductance.
Unfortunately my bench has been co-opted
by other projects and a measurement of Q
at RF is in its own queue.

Also, from the Micrometals website:

"Micrometals recommends that all
uncoated cores should be sheltered from
high humidity or rain since they will
eventually form surface rust."

73,

Chuck

Chuck:

Yes, that is what mainly worries me, oxidizing of the iron core (or, rust.) I am not even sure how the rust would degrade the cores performance; since, the sheer mental picture of the physical look of a corroded balun is enough to make me attempt to escape this condition. I have "revived" old oxidized cores with tripoli and a buffing wheel, then a protective coating.

I always attempt to waterproof any balun I make. Sometimes this takes form as an old plastic container with holes in the bottom for any water which leaks in to escape, but keeps the rain off ...

269. measuring cable loss

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-09 12:13:45 UTC
From: Jimmie D <GFENDER@carolina.rr.com>
Message-ID: <46bb04f9$0$4729$4c368faf@roadrunner.com>
Source record: 37483

I need to measure the loss of aproximately 200ft of coax @ a freq of 1Ghz. The normal procedure for doing this is to inject a signal at one end and measure the power out at the other. Using available test eqipment this is a real pain to do. I propose to disconnect the cable at the top of the tower terminating it in either a short or open and measure the return loss at the source end. I have done this and measured 6.75 db and I am assuming that 1/2 of this would be the actual loss of the cable. These numbers do fall within the established norms for this cable. Can you think of a reason thiis method would not be valid?

Hi Jimmie

I consider "return loss" to be a ratio related to the mismatch of the load
to the line. A short on the end of a low loss line will have high Return
Loss. You probably did some math that isnt apparent in the statement "I am
assuming that 1/2 (of 6.75 dB) is the actual loss". .

How difficult would it be to take a length of some decent RG-6 up the
tower to send the signal down to the *lower end*?

Jerry

271. "Extension" antenna ?in?sanity check, please?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-09 13:50:46 UTC
From: Don Bruder <dakidd@sonic.net>
Message-ID: <46bb1bb6$0$14101$742ec2ed@news.sonic.net>
Source record: 37485

Greetings, folks...
Not EXACTLY ham-related, but since there's about a metric buttload of smarts on radio topics here, figured I might get some useful input.

The situation:
Guess-timated 800 feet of co-ax "abandoned in place" between house and outbuilding. Once supplied CATV signal to apartment in the outbuilding, now connected to nothing at either end. I can't find any definitive markings on the exposed sections to tell me precisely what "flavor" it is, but I'd suspect it's "just plain old Cable TV wire" - RG-58?

The goal:
Run a computer with an 802.11 card (2.417-2.467 GHz) in the outbuilding's apartment, and have the wireless connect to the router in the house. Not possible at the moment due to lack of signal. ("No access point in range" diagnostic from the card's 'ware.)

Secondary goal:
Spend little or no $$$ in the doing.

The restrictions:
The owner of the router in the house forbids ANY modification of the router - no screwing one of those fancy 802.11 range extender antennas onto the beast, etc., but if I can do it using other methods, I'm welcome to.

The thought:
Attach a properly tuned antenna to each end of the co-ax, position the one at the house end as near the router as possible, and park the machine in the apartment near the other end. I'm thinking a sort of "radio pipeline" here.

The workability:
That's where you guys come in! Does this plan fall into the "utterly hopeless - you're nuts!" category, or is it a "Might work, if you sacrifice a goat over the contraption during the dark of the moon whilst chanting to the wireless gods" concept? Or better yet, is it a case of "It should work just fine!"?

Any thoughts/suggestions welcome...

Thanks in advance!

Since you have so much signal at the router, you might get away with it, even though there will be a lot of loss in the coax. Incidentally it is probably RG-59.
Technically, it will work (the antennas and coax will transfer the signals between the two locations).
I'd say you have a good chance at success.

273. Building a T2FD antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-09 16:55:33 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.09.16.55.31.206413@from.qrz.com>
Source record: 37487

I've pretty much decided to go ahead and build a T2FD "radiating dummy load", hopefully for use from 2 to 24 MHz.

This will be almost (but not quite) exclusively for receiving, wherein my limiting factor is usually noise anyway, rather than antenna efficiency. If somebody appears on one of the frequencies I scan that I want to talk to, if he's not S9 or better I'll likely switch over to a "real" antenna. But, the occasional use for transmitting means I'll need the appropriate power resistor on the load end (100 watts or so).

You guys have suggested googling for "T2FD" and "TTFD" and I have done that, but I haven't yet found anything that really lays out how to design and build one of these things, what the formulas are, etc.

Some of the Google hits suggest using baluns and resistor values all the way from 11:1 balun, 550 ohm resistor, and 50-ohm coax to 4:1 balun, 300-ohm resistor, and 75-ohm coax. Some seem to imply that one should use a resistor value equal to the coax impedance times the balun ratio, and others say that the resistor value should be some percent higher than the coax impedance times the balun ratio (one site suggested 75 ohm coax, 4:1 balun, and 390-ohm resistor).

Obviously I'd like to do this a cheaply as possible and I do have a W2AU 4:1 balun sitting on the shelf here, so would 50 or 75 ohm coax, 4:1 balun, and anywhere from 300 to 390 ohms for the terminating resistor work as well as a higher resistance value and a higher ratio, scarce, and more expensive balun?

I have seen formulas, which I can no longer find, that say what the length should be for a given minimum frequency, and what the spacing between the conductors should be. I assume that the spacing of the conductors has a lot to do with the balun ratio and terminating resistor.

I guess if I can find the length, conductor spacing, and terminating resistor value needed for 2 MHz minimum and 4:1 W2AU balun I should be all set.

Thanks...

The terminating resistor of a B&W antenna is 600 ohms resistive i.e.
there is a 600 ohm resistor connected to the ends of the folded dipole
antenna. It's purpose is to swamp the current leftover when the standing

wave is formed. The balun is of necessity a 12 to 1 ratio balun. Other values may be used to other effects.
The biggest problem is the balun. I haven't seen any specs for making one. The resistors need to be carbon non inductive high wattage.

Let us know how you do.

No way you are going to get any significant amount of the Router's 40 or 50 mW of 2.4GHz signal out the other end of 800 feet of that cable, be it RG59 or RG6.

Three options come to my mind at the moment. 1) try a high gain (directional) WiFi antenna at the outbuilding end only to try and get a signal. MFJ makes a tiny yagi for that purpose. 2) possibly obtain another WiFi Router or bridge of your own and connect it by ethernet cable to a port on the owner's router, thus having your own wifi router to play with by adding directional antennas, etc. 3) install a wifi bridge unit somewhere in between the two locations...

I believe there are possibly other ways, too, but I haven't had my morning coffee yet, so that's all I can come up with at the moment.

Ed

Half the return loss is a valid method of determining the transmission line
loss.

Actually I suggested you look at Heys book, or the second edition.
The original one had several pages complete with measurments, how
to build resistors from cheap low power ones and so on.

> Obviously I'd like to do this a cheaply as possible and I do have a W2AU
> 4:1 balun sitting on the shelf here, so would 50 or 75 ohm coax, 4:1

> expensive balun?

You can wind a 9:1 balun pretty easily, I found that for HF, you could
make one from torroids found in PC power supplies. I tested the ones
I made with a dummy load and ran some power into them. If they got
hot, I did not use them. :-)

However Heys does not suggest you use a 9:1 balun, he suggests a 4:1.

> I have seen formulas, which I can no longer find, that say what the length
> should be for a given minimum frequency, and what the spacing between the

> lot to do with the balun ratio and terminating resistor.

While they are not extremely critical, they need to be pretty close.
If you change the geometry of the antenna, you change how it acts.
Too narrow and it becomes a folded dipole with a center load and
too wide it becomes a rhombic or rectangular loop.

Note that the antenna needs to be mounted at specific angle with a
a specific height from the ground. Changing them changes the way the
antenna works.

Captain G. L. Countryman, USN(W3HH*), who developed it, placed it over
conductive ground (the sea shore), but it seems to work well over
regular ground too.

> I guess if I can find the length, conductor spacing, and terminating
> resistor value needed for 2 MHz minimum and 4:1 W2AU balun I should be all
> set.

That would be an awfully big antenna. However, I think you could
cut one for 3.5mHz and it would still work at 2. They do work
well at lower frequencies than they are cut.

From Heys' book:

For 1.8 mHz top length 182' 2" spacing between top and bottom 5' 5"".
For 3.6 mHz top length 91' 1" spacing 2'8"

He lists the height as being 35' above ground sloping to 5 feet for a 7mHz antenna and says it would be proportional, so a 3.5 mHz antenna would need to be 70' up. The angle of the antenna is 30 degrees, from the mast to the center of the spacer.

You probably could get away with a 7mHz version, (half of a 3.5 version).

Note that he also suggests using 75 Ohm coax,a 4:1 balun and a resistor made of four rows of six 270 ohm 2w resistors for a 100 watt CW or 300 watt SSB transmitter.

I suggest that before you go any further you get a copy of the book.

Geoff.

It will be valid if the Z0 of the line is uniform, and matches the calibration of the instrument you use to measure it. If the Z0 is uniform but different than the impedance to which the instrument is calibrated, you can easily see that effect by measuring the return loss with the far end open and with it shorted. You can get the same info, again assuming a uniform line, and assuming essentially unchanged attenuation over a 2.5MHz span around your measurement frequency, by measuring at multiple frequencies (doing a sweep). If the line is the same impedance the instrument is calibrated to, the return loss will trace out a circle centered on the middle of a Smith display (assuming that display is referenced to the instrument's impedance); in any event, the circle will be centered on the line's Z0. If the line Z0 is non-uniform, expect the attenuation to vary with frequency; the Smith display of a sweep likely will be quite non-circular.

Cheers,
Tom

One on-line coax-loss calculator indicates about 144 dB of loss in
RG-59, at 2.4 GHz over an 800-foot span.

Added to the antenna losses at both ends, and I have real doubts as to
whether a usable signal will result. It *might* work if the 802.11
radios were plugged directly into the coax, with no antennas involved,
but that does not sound feasible.

>I'd say you have a good chance at success.

I have serious doubts.

I'd suggest another approach - use the coax to carry wired Ethernet
(perhaps with a simple 1.5:1 unun at each end). Losses will be far
lower at 10 MHz than they are at 2400 MHz. 10Base2 (over RG-58) is
spec'ed for up to 600 feet per segment, and 10Base5 (over RG-8) will
go more than 1500 feet.

It'd be necessary to install a 10BaseT-to-10Base2 bridge next to the
router, and some other sort of 10Base2 termination at the outbuilding
(another bridge / router / access-point).

Although most consumer-grade Ethernet products on the market these
days are 10BaseT- or 100BaseT-only, it's possible to find older
Ethernet hubs and switches with 10Base2 BNC jacks fairly easily on the
surplus market.

Hi Rick,

I've seen discussion about cutting the length of this air-cooled
resistor (what do you mean almost exclusively receive? Use a 1/4 watt
resistor then!). A halfwave design at 2 MHz is going to be 6
wavelengths long at 24 MHz. The resistor/BalUn may match well, but
the resulting lobes may not point where you expect them to.

Very small antennas (let's say halfwave for 20M) will receive 2 MHz
quite nicely (or as well as the resistor will allow); and point in the
direction (broadside) you expect for any of these frequencies.

>If somebody appears on one of the frequencies I scan that I want to talk

Because the one time I need to transmit on it, I'll blow the resistor.

> You don't seem very committed to any particular "general" solution; so
> what is your real goal?

I'm active in CAP and MARS on frequencies from 2 to 24 MHz. I need to be able to program all of the frequencies of interest into my FT-1000 and put it on scan, then if someone I need to talk to shows up (and is strong) on one of the channels in my scan, I can just pick up the mike and call him.

I have two inverted vees fed with ladder line and tuners that I normally use, but they're not suitable for scanning because one of the tuners is manual and the other one can't keep up with scanning different channels even if I had a computer interface for it so I could tell it what frequency I'm listening on.

I could just throw out a random length wire, without a tuner, and use that for receiving but I wouldn't be able to transmit on it when someone I need to talk to shows up on one of the channels.

Hence, right now at least, the T2FD looks like the only viable short-term solution for the scanner... a longer term solution will be an array of cut dipoles whose fundamental or odd harmonic is near one of the frequencies of interest, but that's going to be a while coming.

==========
A 12:1 ratio balun is decribed by Jerry Sevick , W2FMI in his book :
"Building and using Baluns and Ununs" , pages 54-55
It is in fact a combination of a 1:1.33 Unun and a 1:9 (type Guanella)
Balun , hence for an impedence transformation of 50 Ohms unbalanced to
600 ohms balanced. The unit has 4 toroids.

SNIP

It may be worth adding that even when
the line is neither uniform nor matched
to the impedance of the RLB, the
measured return loss will correctly
indicate the sum of losses due to the
mismatch and to the line losses.

When the line impedance is uniform, the
mismatch loss can be simply calculated
and the cable loss can then be found.

73,

Chuck

If you get a pair of preamp/power amp modules, like these:
<http://cgi.ebay.com/2-4GHz-802-11b-1-Watt-WiFi-amplifier-signal-booster_W0QQitemZ58456080
31QQcmdZViewItem?hash=item5845608031&_trksid=p3286.c50.m20.l1116>
and use them at both ends of that long run of coax, it might work. But
at $186 times 2, that's rather expensive for something that's not
guaranteed. At least, with the amps feeding directly into the coax, you
probably would have a minimum of interference from other wifi users and
microwave ovens.

>and use them at both ends of that long run of coax, it might work.

Even that might be marginal.

One site I Googled stated a WiFi receiver sensitivity of -76 dBm. A
typical WiFi card has a transmitter output of around 15 dBm, and
access points may be up in the 20 dBm range. That'll allow for only
about 100 dB of attenuation between transmitter and receiver before
you can't get a good connection any more... and the estimate for the
RG-59 coax was 45 dB worse than that.

Boosting the power to 1 watt will give you between 10 and 15 dB of
additional signal... still far short of the 45 dB of additional power
and/or sensitivity needed for a connection.

Running 2.4 GHz over thin cable is just sorta silly... especially when
there's a decades-old, well-tested, and very reliable cable-based
technology which will give equal or better data rates due to much
lower attenuation at lower frequencies.

If you are really serious about grounding the tower you can run copper
braided ground wire from an air terminal on top of the tower to a ground
system below but this is not normally done on amateur towers.

> values may be used to other effects.

I don't know that the balun ratio corresponds to the resistor value
necessarily, although it's true that B&W's patent essentially says that.
One might spend a few minutes modeling various combinations to find out.

Looking at W4RNL's page:
http://www.cebik.com/wire/t2fd.html
says
"(The general recommendation is to use a terminating resistor that is
about 5% to 10% higher in value than the feedline characteristic
impedance.)"

One might also look at B&W's patent (4,423,423)
http://patft.uspto.gov/netahtml/PTO/srchnum.htm

"The non-inductive resistive network 78 is preferably a single wire
wound resistor having an impedance dependent upon the selected frequency
range of the antenna. This impedence must be totally non-inductive for
the antenna to function properly. The resistive network 78 must also
have a power dissipation capability which should be at least one quarter
of the power transferred through the antenna matching means 46 to the
antenna from the radio frequency generator. Of course, in order that the
environment not affect the operation of the resistive network 78 the
casing 80 should be weather proof.

The antenna balancing or load impedance is chosen to give the antenna
its broad band characteristics while retaining its shorter overall
length. It has been found that a load impedance in the range of 100-900
ohms will work satisfactorily with an antenna having a frequency range
of 3.5-30 MHz and an overall length between 50 and 130 feet. A load
impedance of 600 ohms is preferred because it increases the bandwidth of
the antenna while decreasing the voltage standing wave ratio associated
with each frequency in the 3.5-30 MHz range. Since the output impedance
of the radio frequency generator is most often 50 ohms, the ratio
between the two coils 74, 76 of the antenna matching means 46 will be
12:1. The antenna load impedance of 600 ohms works equally well with a
frequency range of 7.0-30 MHz. However, for bandwidths which include
lower frequencies, such as 1.8 MHz, and for other frequency ranges of
smaller bandwidths, other impedances in the range of 100-900 ohms may be
preferred in order to decrease the voltage standing wave ratio for those
frequencies while permitting transmission and reception over a
continuous bandwidth. With the use of a smaller impedance in the antenna

balancing means 44, the ratio of the coils 74, 76 in the antenna
matching means 46 and the length of the antenna will vary to reflect
such changes.
"

"An antenna balancing or load impedance of 800 ohms has been found to
cause the antenna 90 to perform quite well where said antenna has a
frequency range of 1.8-22 MHz and an overall length averaging 185 feet.
The 800-ohm load impedance is preferred because it increases the
bandwidth of the antenna while decreasing the voltage standing wave
ratio associated with each frequency in the 1.8-22 MHz range. This
impedance increases the ratio between the antenna matching means and
output impedance of the radio frequency generator to 16:1.
"

> The biggest problem is the balun. I haven't seen any specs for making
> one. The resistors need to be carbon non inductive high wattage.

Or those nice inexpensive Caddock non-inductive resistors available from
Mouser for about $2 each for the low power versions, up to $10 each for
the higher power ones.

http://www.mouser.com/catalog/631/552.pdf

http://www.caddock.com/Online_catalog/Mrktg_Lit/MP9000_Series.pdf

available up to 100W rating (assuming bolted to an appropriate
heatsink). I'd string together a bunch of an appropriate resistance,
either series or parallel, your preference.

Sounds right...

Send the signal up, have a loss of 3.375 dB, all of it reflects back
from either short or open, another 3.375 dB loss, so the reflected
signal is down 6.75dB.

If you wanted to get real fancy, you could terminate in a known mismatch
too..

But that's getting up towards doing port cals on a VNA.

I assume you're not looking for tenth of a dB precision?

Jim

Actually, almost any antenna with a 5 dB attenuator would work. a 5 dB
pad would give you a return loss of -10dB, which is around 1.9:1 VSWR..

According to Cebik's models, the T2FD is down about 6 dB relative to a
dipole, worst case, so it would be almost the same.

All you need to do is build yourself a BIG 6dB attenuator that can
dissipate the power.

You've got a bit of a challenge, then.. although +/- 1 dB (is that a 1 sigma or a 3 sigma or a absoulate max min spec?) might not require a tenth of a dB precision.

1 dB is 25%
1% is 0.04dB

(measuring power at 1 GHz to 0.1dB absolute is moderately challenging, especially outdoors) For reference, an Agilent E4418 is specified at +/-0.6% (25C +/- 10 degrees).. plus you have a linearity spec which can range from 1% to 4% depending on the relative levels of the reference and unknown.

A good return loss measurement with a decent PNA (like an E8363) should get you down in the sub 0.1dB transmission measurement with overall loss in the 0 to 20dB range, so the measurement is clearly feasible at some level.

The same piece of gear, measuring reflection coefficient (i.e. the put a short or open at the other end, and measure mag(rho) and work back to loss)... you said you have about 6dB return loss, so that's a reflection coefficient (at the analyzer) of about 0.5, and for <2GHz, the uncertainty would be about 0.01 (out of the 0.5), or, call it 2%... again, about a 0.1 dB uncertainty.

OTOH, that's a $50K piece of test gear, sitting in a lab at 25C +/- 1C

There's also the temperature coefficient of the coax to worry about. Copper has a temperature coefficient of 0.4%/degree C. A 10 degree change in temperature is a 4% change in resistance (0.2dB), and the resistance is a big part of the loss (dielectric loss changes differently, and you'd have to worry about the dimensional changes too).

In any case, measuring the loss by terminating it in a reflection is probably the easiest way, and potentially the most precise, because you can have the source and the measurement at the same location. If you tried to measure it by transmission loss (put the source at one end and the detector at the other) you have the problem of the stability of the source. In a bridge type scheme (which the reflection technique is) you

can essentially compare between the unknown (your cable) and a standard, and adjust the standard until they match, so the variations in the power level of the source cancel out (or use something that inherently measures the ratio of the powers).

Something like the LP-100 wattmeter can probably make the measurement. It's good to 5% typical, and can do ratioed/match measurements to much better. I don't know if it can go to 1 GHz, though.

Something like the Anritsu SiteMaster (like the S311D) can do this for sure(after all, it's what it was designed to do.. measure coax on towers) http://www.us.anritsu.com/downloads/files/11410-00419.pdf

If you need to measure loss on the fly, it's a bit trickier, but one way is to put a deliberate small mismatch at the end (i.e. you put a 10 dB directional coupler in the line at the antenna end, with the coupled port terminated into a short). This reflects a known -20dB back down the line. You look for changes in the amount of reflected power. Obviously, if the antenna changes it's reflection, you have to separate that out. There are clever techniques for this too (like having the coupler terminate in a switch that is either a load or a short). This kind of thing is pretty common on antenna measurement ranges, where you need to remove the effects of the feed cable from the measurement.

Dear Frank:

I remember who distributes Tennadyne antennas in your part of the world.
He is EI0CL. It seems to me that he has a sub-distributor in Spain.

He has a site at:

http://procom-ireland.com/

73, Mac N8TT

From: "J. Mc Laughlin" <jcm@power-net.net>
Subject: Re: 2L Steppir or 2L Cubical quad
Date: Monday, August 06, 2007 10:49 AM

Dear Frank (no call, France?):

Another choice is a log-periodic-dipole-array (LPDA). Several are
available that do a good job of covering 14 MHz to 30 MHz. One such
manufacturer is Tennadyne

http://www.tennadyne.com/specs&prices.htm

The link shows the specifications of most of their models.

LPDAs have no moving parts and everything is in a plane. If you purchase
one, I can offer a couple of very simple (almost no cost) enhancements.

As I recall, Tennadyne has a distributor in your area.

73, Mac N8TT

Jim good points and all noted.

Jimmie hasn't give a lot of detail about the specification he is apparently trying to meet. Reading between the lines, it might be an EIRP, and assuming a given antenna gain, he is trying to calculate the permitted transmitter power output.

Not only is the uncertainty of practical service equipment an issue in tenth dB accuracy, but no mention has been made of transmission line loss under mismatch conditions, and mismatch loss.

Jimmie, if you have a plausible story to tell the regulator, then that might suffice.

If you have assessed the Return Loss of a rho=1 termination, then you could use that and the measured Forward and Reverse power using say a Bird 43 at the transmitter end of that known line loss (being half the return loss) to calculate the power absorbed by the load. The calculator at http://www.vk1od.net/tl/vswrc.php does just that. The calculator at http://www.vk1od.net/tl/tllc.php could be used to calculate the expected RL of the o/c or s/c line section, just specify a load impedance of 1e6 or 1e-6 for each case. For example, at 1GHz, the RL of 200' LDF4-50A with a 1e-6 load is 8.9dB, and if you got much higher than that, you might suspect the cable to be faulty.

Tenths of a dB, remember that most service type power meters are probably good for 6% to 10% of FSD, so I will go with Jim's 1dB accuracy.

BTW, directional wattmeters for the ham market are often not capable of reasonable accuracy on loads other than the nominal 50 ohm load. There are a range of tests that such an instrument should satisfy, but for hams, it is usually considered sufficient if the "reflected" reading is approximately zero on a 50 ohm load.

Sounds like using my network analyser to measure return loss at the TX in an
envoromentally stabalized building is going to be a lot better than taking
my HP power meter up on the antenna in the middle of the night to measure
the power level at the end of the cable.

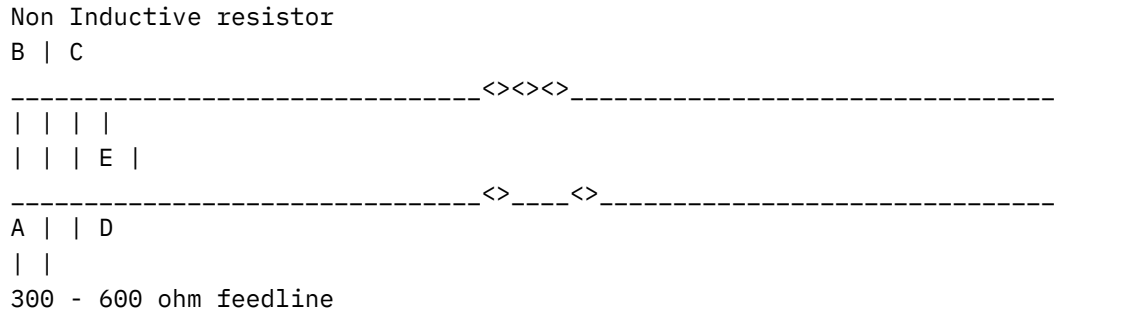
Rick, pretty much the only good treatment of the terminated tilted folded dipole, (T2FD) I've found in Practical Wire Antennas by John Heys, an RSGB book published in 1989.

Apparently there are also articles in June 1949 QST, and CQ Antenna Roundup 1963.

While some describe the T2FD as a broadband resistor, it's most salient characteristics are it's broadband coverage over about a 4:1 ratio, and with the 20 - 40 degree tilt, an aperiodic vertically polarized radiator. It can be fed with 300 ohm line.

The optimum tilt of the antenna is about 30 degrees.

My skills with ascii art aren't that good, but I'll try to describe the antenna.



Of course it must be tilted at 30 deg from vertical.

The length of each leg when measured from the centre of the wires across the spreaders to the feedpoint or terminating resistorshould be 50,000/f(kHz) X 3.28 feet. The total top length and the lengths AB and CD will be twice this calculated length. Frequency f is the lowest operating frequency of the antenna, although it will work at half this frequency with reduced efficiency. The spacing between the two radiator wires in feet is found by dividing 3000 by the frequency in kHz and multiplying this by 3.28.

The terminating resistor must be non-inductive if you want the antenna to work over a large frequency range. It will still work in an inductive resistor is used but it will become resonant on one or more frequencies and the feeder must be used as a tuned line.

The terminating resistor is to some extent determined by the impedance of the feedline. With 300 ohm twin lead, the optimum resistor value is about 400 ohms. With 450 ohm line, a 500 ohm resistor is fine and 600 ohm line needs 650 ohms. Keep in mind that 50% duty cycle of CW or even lower of SSB wattage needed in the resistor. Of course RTTY or FSK will dissipate even more power.

The article suggests that 24 270 ohm 2W carbon film resistors, wired into four lines of six resistors in series, and then paralleled would produce a final resistance value of 405 ohms, and would allow 300 watts on SSB.

Hope this adds to the discussion.

I think I have given enough info. But I will try yo expess it in another way.
Power delivered to the antenna but be maintained with in +- 1 db in this case that power is 100 watts. Power is normally
checked at the TX and recorded after allowing for line loss as "power at the antenna". Power checks are done on a weekly basis. Once a year the line loss is measured and this value is used to subtract from the power at the transmitter for the rest of the year. With this in mind it would be most prudent to measure the cable loss accurately. to establish the annual benchmark.

Considering the test equipment I have available to use in a temperature stablized building an Agilent network analyzer or use an old HP power meter at the top of the tower I am thinking that measuring rho of the cable while terminated in a short may be the more accurate way to go.

Ok.

You haven't mentioned how you intend to deal with the likely case where
VSWR<>1.

> Considering the test equipment I have available to use in a
> temperature stablized building an Agilent network analyzer or use an

Yes, especially if the NA is calibrated against o/c, s/c and Zo locally.

If for example, you discover that the one way matched line loss is
6.75/2dB (3.375dB), and you measure the fwd and reflected power at the tx
end to be say 200W and 15W, you could use the calculator I mentioned to
determine that the VSWR at the antenna was 1.36. Using that, and setting
forward power at the antenna to 102W for a net power to the antenna of
99.6W, forward and reflected at the tx end of the line should be 222W and
1.1W.

Of course, if the line was perfectly matched, you could just set the tx
end forward power to 100*10^(3.375/10) or 217W and reflected would be
zero... but that is unlikely. You could take the easier, simpler and
conservative way out and just set it for 217W forward irrespective of
mismatch.

It is splitting hairs, but sometimes precision in the method distracts
attention from accuracy!

Owen

using the calculator I mentioned, and setting the line loss to the tx to
3.375dB, loss to antenna to 0, tx power to

Hmmmm ...

Any suggestions for a method for dumping the heat from the resistors
back into the shack in the wintertime? :-)

And heck, during the winter, wouldn't it be nice to have the resistors
overall rating able to dissipate a KW and provide more heat?

I met a guy at a campground who wants to put up a 1/4 wl verical on 40M but doesnt have room for a good ground system. This is what he wants to try.

He has an old trampoline frame 16ft in dia that has about 120 springs on it so he is going to run 120 wires from a center hub to the outer rail of the frame.
each wire about 8 ft. Then run 5 or 6 wires spaced evenly around the frame on out to the 1/4 wl mark. I was hoping there would be someone willing to model something like this for him. All I have is the free version of EZNEC and dont think it will handle the job.

I should think, though, that one could calibrate such a reflectometer/directional wattmeter. That is, you could test it with a suitable variety of source and load impedances and develop a fairly simple arithmetic correction that would be accurate.

The interesting question might be whether you could unambiguously take a particular fwd and rev reading and turn that into a true fwd and true rev, essentially solving for the mismatch.

Down in the lab here at work we have a whole rack of precision misterminations (1.1:1, 1.2:1, 1.5:1, etc.) that some talented engineer built and calibrated some decades ago. They're built on the Maury bluedot N terminations.

Since the amount of heat dissipated in the resistors will only be 30-40
watts when running 300 watts SSB output, and since they're halfway up the
antenna, I doubt very much that you'd get much heat output.

It's easy to up the wattage rating, but it costs $ to get high wattage
non-inductive resistors.

Yes Jim, some of the deficiencies of the instrument fall to things like an equal response from the separate forward and reverse couplers. Scale shape is an issue (especially where the sensitivity is continuously adjustable using a pot). Phase and amplitude response of the coupler over the frequency range is another issue not so readily calibrated out. A coupler that is long will underestimate rho, and some couplers insert more mismatch than they pretend to measure.

In my experience, many of the instruments that are claimed to work up to 144MHz band might well indicate close to 1:1 on a dummy load, but they do not indicate rho=1 on a s/c or o/c. Whilst they may serve their purpose as a null indicator on a 50 ohm load, they are not suited to the loss measurement such as Jimmie is performing.

I don't think you can compensate for lack of f/b ratio in the coupler, for example because the coupled lines are too long.

I have always though that a budget priced set of mismatches would be real handy, and have wondered why MFJ (or someone else for that matter) don't offer a set for checking / calibration of the MFJ259B etc.

Ohhh, well, that certainly changes everything, doesn't it?

How about just constructing the antenna out of ni-chrome wire, that way
it will be self-defrosting?

As I mentioned before, be sure the cable is really 50 ohm (assuming your instruments are calibrated to 50 ohms), or at least determine what it is. Make your rho measurement; at that length of line, you can adjust the frequency of measurement over a small range and get values for rho at angles of 0 degrees and at 180 degrees. I will assume that the cable is 50 ohms and the cable attenuation changes practically none between the two readings, so the readings will be the same. Now without changing anything, measure an attenuator with nearly the same attenuation your think the cable has, also open-circuited/shorted at the output. If the attenuator has the same attenuation as the line, you should get the same value. You can then have that attenuator calibrated at 1GHz to make sure it's correct. Because your measured attenuation is twice the line attenuation, you will get the line within 1dB if the measurement is within 2dB. It shouldn't be very expensive to get a couple attenuators that would bracket the line loss, and have them calibrated, and expect that they would hold the calibration for a relatively long time if they aren't mistreated. Seems like we never see much variation from one cal to the next of decent attenuators.

As Jim noted, beware of environmental changes. I don't think that dimensional changes will much matter, but the copper resistance will, some. The effect, though, is not nearly as much as Jim suggested, because of skin effect: a 1 degree C change causes the DC resistance to change by 0.4%, but the AC resistance changes by only 0.2%. Since the dB attenuation due to copper resistance is linear with resistance, if the line attenuation is about 3.5dB, you'd need a 10% change in AC resistance to see an 0.35dB change in attenuation. That's a 50 degree C change, perhaps worth worrying about if you're in an extreme

climate. Looking at it another way, it's about 0.007dB/degree C.
It's probably worth making a point to measure the line loss at or near
the temperature extremes it experiences, though that would mean
climbing the tower at a couple times you might least like to. Be sure
moisture doesn't get into the line!

Cheers,
Tom

Ian-

Local stores carry the SDS+ drills, but I have been unable to locate a
local source for the 1/2 inch nut driver (socket adapter) to use with it.

I did find a Hitachi part number. A Hitachi dealer called the company
to see about ordering one. Hitachi agreed it was a good number, but
they didn't have any and didn't know how to get them!

There is a company in the UK called ScrewFix.com that advertises them.
However, I don't know how to handle the conversion between dollars and
pounds when paying. I wonder if the credit card company can take care
of that automatically?

Tom, I was thinking of several instruments, all of the coupled lines type of construction, that on a s/c and o/c failed to indicate rho=1, and showed similar readings when physically reversed, suggesting it was not just a fwd / rev matching issue, there was something about the coupler that was too dependent on the location of the SWR pattern relative to the coupler. Since they worked better at lower frequencies, the length of the coupler was likely to be a contribution.

Jimmie, I am talking about the el-cheap inline SWR / Power Meter that is
often sold to hams with unrealistic specs.

You can / should always test the performance of the kit you are using to
determine if you should have confidence in it.

There are a bund of notes on testing a directional wattmeter in the
article at http://www.vk1od.net/VSWR/VSWRMeter.htm .

BTW, for your purposes, if you had a Bird 43 with an element that read upscale on fwd power (250W element for your application), it is all you should need to form a reasonable estimate of line loss and set the transmitter to deliver 100W to the antenna. You might need a smaller slug to make a measurement of RL on a s/c or o/c termination.

Message-ID: <vEbvi.29011$Vk6.2479@newsfe07.phx>
Source record: 37387

My friend had a 4-element 2m quad with dangerously high VSWR. Somebody gave it to him (which I guess was the first sign). Yesterday, he brought it by for me to check it out.

I don't have an analyzer (yet) for 2m, but careful VSWR measurements made it look like the antenna was resonant out-of-band low. We carefully measured the driven element length and compared it to the calculated length from the ARRL Antenna Handbook. It was about 1.3 inches too long, so we stripped out the spreaders, redrilled and reassembled with a shorter driven element. Voila! 2.1:1 to 2.4:1 across the bad, with the low point in-band. He went on his way, happy.

Last night I studied a little and saw that the quad loop is normally resonant with about 100 ohms at the feedpoint. I used some # 12 wire to build a 222 MHz quad loop today and, sure enough, 2.1:1 was the best I could do. I remembered the use of a quarter wave section of line as a matching transformer and decided a transformation of 50 --> 75 --> 100 was too easy not to try. At 66% velocity factor, that's just over 23 cm of RG-59.

It worked perfectly. Resulting VSWR was better than 1.4:1 from 222 to 225. From my location south of San Diego, I brought up several distant repeaters (Hollywood Hills, Catalina) and even worked a guy in Santa Barbara through a repeater at his end, over 200 miles away. All this with 5 watts to my humble quad loop on a 9-foot plastic stick tied off to the patio cover.

I understand that a quad loop has a pattern about that of a dipole and a quad array will deliver useful gain with just one parasitic element. Dunno if the parasitic should best be a reflector or a director but I'll find out. I built a reflector but haven't tested it yet in conjuction with the exisiting loop. That's next.

I love this hobby!

Hi Owen,

I've recently done at least a cursory study of the coupled-line
hybrid, and I found nothing to indicate that directionality is
affected by the line length. In fact, the usual length where it's
practical is 1/4 wave, since that's the length that provides maximum
coupling, and the coupling near that frequency changes only gently
with changes in frequency (falling off on either side). I was
particularly interested in finding that the directionality is
independent of the length, assuming uniform cross-section at least.
If this is in error, I'd really like to know about it, because it
affects something I'm working on.

I'm not sure exactly what sort of bridge is used in microwave network
analyzers; I do know that the ones we build out to a few hundred MHz
use resistive bridges, which are relatively frequency insensitive. (A
key trick is how to read the bridge imbalance without introducing
errors...)

Cheers,
Tom

Interesting findings Tom.

The way I think of these couplers is that you are trying to sample V and I at a point on the main line, and a longish coupler of that type departs from that ideal.

The effect I observed, and in several instruments, was obvious and repeatable. I wonder that if the length of the lines is not the cause, if it was the untidiness of the way in which the detector circuit was implemented at each end of the coupler section. Of relevance also, is that insertion of the instruments also caused significant SWR (>1.2 in the case of one of them) at the extreme uppoer end of their specified range. IIRC two of the instruments had no equalisation / compensation, they had a resistor at one end of the coupled line and a cap/diode at the other end.

I still have one of the things that did this, and I have since nulled it for 75 ohms, but I will have a play with it when I get home next week.

That's where I bought mine. I have posted a photograph of the whole
setup at:
www.ifwtech.co.uk/g3sek/misc/rod-driver.jpg

The adapter is the object between the socket and the chuck (not quite in
its original condition - the rust and weld spatter are aftermarket
accessories).

As I said earlier, the socket is only there to prevent the driver from
jumping off the end of the ground rod, so it only needs to be a very
loose fit.

Yes, that is done automatically. However, you may pay more in shipping
charges and US Customs duty than the cost of the item itself.

Rather than go to all that trouble, you might do better to have
something made locally.

The only special part is the slotted shank that snaps into the chuck. This is exactly the same on every SDS+ drill bit and tool, so you can simply buy the cheapest item you can find (probably a small masonry bit) and chop off the end that you don't need.

Then find a short piece of steel tubing that will slide loosely over the end of your ground rods, and have the two parts welded together.

This can't be too hard, can it Ian!

I just looked on Ebay here in Oz, and I can buy a 20mm SDS chisel for about $14 delivered. I would cut the shank just above the chisel end and slip a 50mm long piece of 20mm NB steel pipe over the remaining shank end, weld it on, and there you go. Ideally, the end of the tool should be harder, but if you are only driving a few rods, you probably won't split the collar.

Wrap your copper clad earth rod with a good few wraps of electrical tape so that the tool does not noodle up the end of the electrode.

Protect your eyes when using this type of tool, especially improvising tools from cheap asian chisels.

Tom, for avoidance of doubt, I am not talking about the type of directional coupler that uses a couple line and that you would terminate with matching load. I am talking about the cheap VSWR meters that have about 100mm long coupled line, that is quite tightly coupled, and the resistor at one end of the line is adjusted to balance the electric field sample with the magnetic field sample for a null reading with V/I=Zn.

Good idea! The shank part of an SDS+ tool is quite a small diameter, so it's a good idea to buy some kind of tool that widens to about the same diameter as the ground rod.

>Ideally, the end of the tool should be
>harder, but if you are only driving a few rods, you probably won't split

>
The collar needs to be a *loose* fit over the rod, so there should be no risk whatever of it splitting.

>Wrap your copper clad earth rod with a good few wraps of electrical tape
>so that the tool does not noodle up the end of the electrode.
>
The ground rod is only mild steel, so the top of it will probably mushroom over anyway (which is the main reason for making the collar a loose fit). In general, you'll have to plan on making the connection a few inches below the very top.

>Protect your eyes when using this type of tool, especially improvising
>tools from cheap asian chisels.

Even the cheapest SDS accessories have to be made from good tool steel, or else they couldn't handle any normal use. Also, the collar acts as a

safety guard around the place where the hammer action is being applied.

However, protection is always a good idea. When you're driving a typical 4ft rod, the action begins right up at chest level, and then moves slowly downward past other vulnerable parts of the anatomy.

Well it a done deal,
Engineering support came out last night and ran the checks for us while Im on vacation and recovering from minor surgery, Yaaay. They did it the normal way and by measuring the return loss and they decided the "return loss method" worked better. Not sure what better means at this point. accurate enough and easier and faster would constitute better.

Don't overlook that you can parallel two quads to get to 50 ohms as
well!

There is no end to the fun with VHF Quads. About any kind of sticks,
wire and tape will get you going. Don't forget to keep notes, they are
very useful as the learning accelerates.

An interesting idea, but it is doomed by the springs. 120 springs
amount to 240 bad connections that will generate both noise and TVI.
Six radials is not bad for the vertical and I have to wonder if he can
do that many he can do a dozen.

Actually, the 120 wires planned on the trampoline will work very well
on the ground...

This is way too complicated for me!
My solution would be to build/buy an RF probe and permanently mount it
at the top of the tower. Bring a pair of wires (Coax if you want it to
look really professional) down to the bottom and measure it whenever
or even all the time.

Climb tower once.

If the speed of the "Drop" is measured in "measurable electricity" - then what is
cycle time of the measuring device in Question?

So, in other words - if the "measuring Device" is working at the same speed of
the thing that it is measuring (or faster) then how can it measure what it is
measuring?

Supposedly the cycle time for low voltage is about 1000 times per second versus
AC which is 60 times per second ... so is the device you are using "capable" of
doing the job at all? Just a Question?

Here is my Web Site URL ... it might have some interesting solutions - or Questions?

Hi Jimmie,

Given the long and winding road to this point, it would give me pause
that suddenly something became "normal." The remainder of your post
is in contradiction to your earlier statement:
>On Thu, 9 Aug 2007 08:13:45 -0400, "Jimmie D" <GFENDER@carolina.rr.com> wrote:
>>The normal procedure for doing this is to inject a signal at one end and
>>measure the power out at the other.
For the sake of clarity (normality aside), what you originally
described Thursday is called "insertion loss."

>On Fri, 10 Aug 2007 01:17:31 -0400, "Jimmie D" <GFENDER@carolina.rr.com> wrote:
>>Power delivered to the antenna but be maintained with in +- 1 db in this
>>case that power is 100 watts. Power is normally
>> checked at the TX and recorded after allowing for line loss as "power at
>>the antenna".
This again defines "insertion loss."

>and by measuring the return loss and they decided the "return loss
>method" worked better.

A description of the classic self-fulfilling prophecy.

I presume you mean this to be "the normal way," but it doesn't really
describe a method or procedure (a "way"); instead, it describes an
outcome. There are many "ways" to measure a characteristic called
"return loss." Some "ways" are more accurate than others.

Having introduced this term, "insertion loss," there remains one more
term to consider: "reflection loss." This and "return loss" can be
found scaled on the common form of the Smith Chart.

The distinction to these terms are that "return loss" and "reflection
loss" are a single port characteristic (that port being the "load"
which, of course, is NOT the antenna, but rather the line and the
antenna). "Insertion loss" is a two port characteristic that properly
conforms to your original question.

ALL such losses are defined by the system within which they reside.
This means you have to also characterize the impedances of BOTH the
load and the source. This last requirement is often dismissed in this
forum where the determination of the source's Z is frequently rejected

as being an impossibility (even when it is specified by the equipment designer).

When Zsource = Zline = Zload, then many complexities are removed. I have seen others ask you the characteristic Z of the load with no response by you; and I am certain you have no comfortable assurance about the Zsource of your transmitter. However, to this last, it would be immaterial if Zline = Zload.

>Not sure what better means at this point. accurate
>enough and easier and faster would constitute better.

This, too, simplifies what is an exceedingly difficult determination (of "return loss," "reflection loss," or "insertion loss") for the accuracy you originally suggested. Accurate, easy, and fast are not normally words used in conjunction except in advertising promotions.

The accuracy of any power determination is related to the known Z of
1. The load;
2. The source;
3. The detector.

At 1 GHz, these determinations are not so easily dismissed as trivial, nor confirmed by dragging a $20,000 analyzer into the shop. The analyzer answers the problem of knowing its own source Z, but it does not answer what that source Z is of the transmitter (again, only a necessity in the face of returned power).

Now, given no one has actually correlated accuracy to any metric here, and given that accuracy is determined in large part by the three Zs above; then a little more discussion is in order. Using only two (the detector and the load could be interchanged for the simpler analysis):
Zsource = 100 Ohms
Zload = 33.3 Ohms

view in fixed font:

1 - Gammaloadï¿½
Error = ------------------------------
(1 ï¿½ Gammasource ï¿½ Gammaload)ï¿½

Error = +0.42dB to -0.78 dB

These errors are independant of other errors such as instrumentation error (meter linearity, conversion problems, ...) or operator errors (reading the meter - a mirrored scale is required to keep this below 5%). Modern instrumentation (if you have the $$$$) solves some of this, others dismiss it as a trivial concern and rely on name brand (Bird is frequently uttered to achieve perfection).

Now, as to the variability in the error wholly associated with just the Zs (providing you can accurately determine them - yes, a game of infinite regress). The allowable error of 1dB is nearly wiped out with some very possible characteristics and you haven't even begun

balancing the error budget. With luck (a fictional village where every armchair technician resides) the error induced by mismatches could be 0. That luck demands you know the length of the line (again, with some accuracy - I enjoy the irony here too). The variation built into the Error computation is from not knowing that length (as is common, few know this with enough precision in wavelengths). At 1 Ghz, the characteristic of
>>aproximately 200ft of coax
is apocryphal.

Hi Jimmie,

There is a simple fix to the Doom as it is practiced with spring mount antennas on fenders and bumpers: short the spring with a wire slightly longer than the maximum extension of the spring.

As for the actual wire inside, use Flexweave from the Wireman. It will make storage infinitely easier.

The advantage of the frame and radial pattern will be found for a shorter radiator (even if at the originally planned frequency). Hence a tuner should accompany the package. If I have time this weekend, I will run a model for you.

What do you all think of using heavy duty nylon rope instead of wire for guys?

I have a Rohn 25G up 50 feet with a 2M/220/440 vertical on a 10-foot mast on top of the tower. It is guyed at 30 feet with standard steel guy wire. I was just up the top of it two days ago installing the vertical, and it seems rock solid.

Now my next project is to put up a 3-element tribander, and while my guess is it'll probably be OK without any additional guying, the paranoid in me says "hey, bozo... put up another set of guys!".

I'm wondering if heavy duty nylon rope will be sufficient. It'll sure be easier to work with, and there won't be the issue of having to break up the guys every so often to keep them from resonating.

There is a ham on the other side of town that has FOUR (4) Rohn 25G's up 120 feet each, arranged in a square, and fed with a phasing network as phased verticals for 80 meters. Each of the four towers is guyed in two or three places with polypropylene rope. Been up a long time and seems OK. But, there isn't a tribander and rotator on top.

> If I have time this weekend, I will run a model for you.

Hi Jimmie,

Time came sooner than I anticipated.

I presumed this tramp'o'tenna wouldn't be raised any higher than 3
feet (which I presumed to be roughly its normal stand configuration)
above ground.

With 120 8 foot radials and a 31 foot radiator, you do encounter a
mismatch with Z at 34 -j134 Ohms. Not bad actually, adding itenerant
extensions would bring in the match, but so would a tuner. I skipped
that exercise. The best launch characteristic stood at -1dB with a
total loss of 6dB. Raising the antenna did little to improve this,
and I doubt you would go 30 feet up to boost the output 1dB.

A shorter radiator of 16 feet with 8 8 foot top hat spokes slanting
down towards the radial rim (guys of part wire, part insulated line)
resulted in a Z at 17 -j8 Ohms. Adding more spokes did not improve
anything (I stumbled on this by accident). Performance was down at
-2dB and total loss at 7dB.

Well, it depends...

Not all plastic rope is UV resistant, so you need to check.

For a given strength, the rope will be thicker and more visible, which
may or may not be a concern to you.

Rope will stretch quite a bit by comparison so the overall structure
won't be as rigid unless you put a LOT of tension on the rope.

Having said that, I have a 40M vertical made of aluminum tubing
guyed with UV resistant rope.

I have to replace the guys every 5 years or so.

I used one of those resistors (sold as motor shunt resistors) for my antenna and constructed a small 5" by 5" heat sink that flys with the antenna. The commercial balun, ($80USD) which was a bit heavy to mount on the antenna was mounted on a fence post underneath the antenna. I constructed some 450ohm balanced line to go between the balun and antenna.

pics:
http://vambo.org/pictures/antenna/

This antenna has been the greatest thing I've ever done to improve my Hobie. This antenna is about 8 years old and has survived a move to a new QTH.

The advantage of using rope is that it's nonconductive, which won't distort the HF yagi's radiation pattern. If you are going to use rope, I recommend you take a look at the comparison chart listed on McMaster-Carr's website (http://www.mcmaster.com/). The material and the construction will have something to do with the amount of stretch, UV resistance, etc. You'll see that double-braided polyester or nylon would appear to be good choices for their UV and stretch resistance.

If you don't place the guys immediately under the yagi, metal guys will work fine if you break up any in-band resonances with insulators. For safety, use *only* compression insulators (not strain insulators). I used to have a homebrew 3-el 15m yagi at 38' (26' mast + 12' roof). Originally, I guyed it w/ #14 solid galvanized steel wire. Eventually, the wire rotted-thru, and down she came (it was not a good day). After repairing the yagi, I replaced the guy wire with 1/16" 1x19 strand stainless steel wire rope (500# breaking strength). That lasted another 15 years until I moved. The wire is still like new -- no signs of rot. It was a worthwhile investment. Because of your increased loading, you'd want to use something stronger than what I used.

You don't want to use the nylon. In a few years the uv rays of the sun will
weaken it. You want to use something made for guying towers. Phillystran
is on type. It is expensive.
http://www.texastowers.com/philly.htm
Has it listed.

Rohn recommends guying a 50 foot tower at the 23 and 45 foot levels. That
is for 3/16 inch steel wire and that cable is rated for about 4000 pounds.
You normally put about 400 pounds of tension on the guy wire. While most
towers will stay up with much less, you can never tell when an ice storm
will hit and a big wind at the same time unless you are in an area that
never gets ice.

You may want to go here and read up on towers.

http://www.qsl.net/n1lo/tower_ref.pdf

Each of the four towers is guyed in two
> or three places with polypropylene rope. Been up a long time and seems
> OK. But, there isn't a tribander and rotator on top.
==========
Polypropylene rope is usually coloured ,blue or yellow or orange or red
. The pigment causes the material to deteriorate due to exposure to UV
(sunlight) .....even here in northern Scotland.
Result : life is approx 8 years
If they would use carbon black (soot) as pigment/filler life of the
material would be infinite ....but then they wouldn't be able to
sell the rope any longer in reasonable quantities.
More expensive alternatives are (black) dacron or polyester rope (the
latter as mostly used for sailing yachts) ;these last for ever.

I currently use polypropylene for guying a 13 metres (43 ft) mast .
The guys have been in use for 7 years and will need to be replaced next
year . I probably will be using polyester rope.

Synthetic guy material is not new, but I have not seen a commercial structure secured with nylon rope, or any other synthetic cable laid rope.

That might just show my lack of experience, but...

I have seen commercial structures secured with synthetic material designed for the purpose, Phillystran is one of the products that you can Google for more information. They are typically a bundle of straight fibres (Kevlar???) enclosed in a continuous waterproof, UV, acid, alkali resistant plastic sheath and special terminals that achieve high strength and prevent ingress of water (which could support mildew, ice damage etc).

Galvanised HT guy wire is much cheaper than Phillystran.

In this part of the world, permanent guys using (natural or synthetic) fibre rope is not generally permitted, so you would need engineering support to justify such an installation. There are good reasons for this.

Hi Owen,

I'm not sure I see the difference. The load on the cheapie you describe is just the load required to terminate that line. I have a freely redistributable field solver program that will calculate the even and odd mode impedances for you from the geometry and the dielectric's permittivity, and from those impedances and the length you can predict the proper termination impedance of both the "through" and the "coupled" lines, and the coupling at any particular frequency. It IS a problem if you try to do it in microstrip because the propagation velocity for the even and odd modes is different, but in true TEM configurations, I believe the directionality is fine if you maintain uniform cross-section. Actually, a way that they make broadband coupled lines is to have a central section tightly coupled, and another section on each end of that which is less tightly coupled. You can extend it to 5 sections or more, to get even broader bandwidth.

Info about them is out there, but it wasn't as easy for me to find as I figured it would be. ;-)

Cheers,
Tom

It seems it is popularly believed that black rope is more likely to be weatherproof than other colours.

There are a range of ropes with good UV resistance that are white, not by accident, the white colour is a result of the technique used to give them enhanced UV resistance. Look around at ropes used in maritime environments and that last for years, they aren't all black, in fact it is rare to see a dark coloured rope at all.

As to the wisdom of taking a rope of known chemistry, then applying paint of non-specific chemistry to protect it without proper regard to the effect on strength or life... I will leave you to think about that.

In this part of the world, riggers are supposed to inspect working fibre ropes and condemn rope that is contaminated with paint or any type of solvent.

Its an antenna rope - so no dangers lurk.
I did not really check its chemistry.

Kool - I'm glad I didn't let one of the riggers from your side of the world
inspect my work. Guys for an antenna will be pretty static so the resulting
stiffness after painting the rope (1/4" cord actually) should not be a
problem.
I used a black latex enamel, strung the rope up and used a "glove" paint-pad

to paint the rope. after it dried, the rope was stronger, and the black coating kept UV from the sun from hitting the nylon directly.
The nylon rope I used was cheap - so probably not UV-resistant on its own. The paint was left over from painting something around the house - so the experiment did not cost too much. But it worked. The paint stayed on - did not flake off, try it.

I haven't read all the posts in this thread, so I'm not sure that the method I'm advancing for measuring line
loss has not already been discussed.

The method I'm suggesting measures the input impedance (R and jX) of the line in question with the opposite
end of the line terminated first with an open circuit and then with a short, at a frequency where the line
will be close to lambda/8. With low-loss lines the R component will be very small, requiring an RF impedance
bridge that can produce accurate values of R in the 0.2 to 2-ohm range. (The General Radio GR-1606A is a
typical example, which, while using this procedure, will yield answers of greater accuracy than the methods
described in the current posts.) With the 1/8wl line the + and - reactances appearing in the measurements will
be approximately the value of the line Zo.

The open and short circuit values are then plugged into a BASIC program that I wrote years ago, which appears
in Chapter 15 of both Reflections 1 and 2. It also appears on my web page at www.w2du.com. The program outputs
the line attenuation, the complex Zo, and the electrical length of the line. The program solves the equations
appearing in Chipman's "Theory and Problems of Transmission Lines," Page 135.

On my web page go to 'View Chapters of Reflections 2' and click on Chapter 15 to see the detailed explanation
of the procedure.

The BASIC program TRANSCON (Transmission-line Constants) is listed there, but to save your having to load the
program from the typed list I will email a copy of the actual operable program to anyone who requests it,
addressing your request to walt@w2du.com.

I hope this suggestion will prove to be of value.

Walt, W2DU

Some additional information that can make it easier to follow the procedure. The section of Chapter 15

describing the line attenuation measurement procedure is Sec 15.3.1, Calibration of the Feedline, Page 15-3,
Chapter 15, and the table showing the results using the TRANSCON program is Fig 15-1, Page 15-4 The TRANSCON
program listing is on Page 15-22.

I never could really figure out a windom except that the origional was just
a flat top that was tuner friendly on all the ham bands.

As I understand it, the original Windom is essentially a vertical
radiator, with an asymmetrical capacitive "top-hat" (which will
probably radiate at least a bit because of its asymmetry), bottom-fed,
working against the station's RF ground. It's simply a form of
Marconi antenna.

The "Carolina Windom" is a very different sort of antenna... AIUI it's
a off-center-fed doublet which (by design) also has some
vertically-polarized radiation from the upper portion of its coaxial
feedline.

Although the two have a superficial resemblance, I believe that the
two types have very different distributions of RF current, feedpoint
impedances, and (probably) radiation patterns and polarization
distributions.

> well!

OK, I took a mental excursion in that direction. My first thought is to use two runs of RG-62 93-ohm computer drop cable off a t-connector. This goes against my grain -- I've always hated using any t-connectors in a matched system -- but I guess the match will be maintained.

My second thought is to literally parallel them at the end of a hunk of 50-ohm cable. That feed would need to be crossed over, I think, so the fields would be additive. Easy enough to test it both ways, I suppose. If crossover is needed, what would the pattern look like without it? Hm-m-m-m ... near-field cancellation and no pattern? Pattern rotation?

Of course I will be trying this next idea even if no newsgroup answer is forthcoming: What happens if I tap off quad #1 on the side _opposite_ where I'm feeding it and connect quad #2 there? Wouldn't this additional load reflect back to feed #1 and lower its impedance toward 50 ohms? I don't know what feed #2 would be. Perhaps a jury-rig parallel line calculated to be 100 ohms would do it. (# 10 AWG wires on 5 mm centers would do it.) Phasing will be an issue.
[I probably don't have a suitable test environment to tell success from failure.]

Hello Jimmie:

Go ahead and spring for Roys Eznec. I think its up at version 5.0. If you want to play your going to have to pay. It offers a the smith chart for the antenna impedance which I like, for matching.

If a 1/4 wave 40 meter vertical is being used then it shouldn't be a big deal to run the ground wires. I'd loose the springs tho.

I helped take down two towers of a SK, who
had his towers shut feed for 80 and 160, and used a massive ground wires. This antenna system was all modeled on Eznec.

Yes, my 1957 ARRL Handbook makes the distinction between
the single-wire feed of the Windom vs the transmission
line feed of an Off-Center Fed (OCF) dipole. The currents
at the vertical wire to horizontal wire junction in a Windom
are flowing in opposite directions in the horizontal wire.
The currents at the Carolina Windom's coax to horizontal
wire interface are flowing in the same direction, more like
an OCF dipole than a Windom. It was probably a marketing
ploy to call it a "Windom" when it was not. "Carolina OCF"
doesn't have much of a ring to it.

What is altered to change polarization (V/H) on a square patch antenna?
I see the corners are cut to make it circular polarization.
But how do you force horizontal or vertical on a square patch?
Mike

360. Can you help identify this rotator?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-12 21:29:20 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.12.21.29.18.205992@from.qrz.com>
Source record: 37423

I found a rotator in some of my silent-key father's stuff and I'm trying to identify it. There is no control box (yet ... it may still be around here someplace) and if I can't find it I'll want to try to buy another one.

See the following URLs:

http://www.rkt-tech.com/rotator/DSCF0002.JPG
http://www.rkt-tech.com/rotator/DSCF0003.JPG
http://www.rkt-tech.com/rotator/DSCF0004.JPG
http://www.rkt-tech.com/rotator/DSCF0005.JPG
http://www.rkt-tech.com/rotator/DSCF0006.JPG

The first one shows the rotator sitting next to a plastic gallon milk jug, for size comparison.

The rest show different views of the rotator.

It looks like maybe a Ham-M or Ham-IV, but my dad also had one of those US Towers crank-up masts, where the whole mast gets rotated, and it seems he had a Tailtwister to turn that ... but this doesn't look big enough to be a Tailtwister.

Any ideas what it might be and where I can get a control box for it?

Thanks...

E-plane is along the "length" dimension...the E-vector points from the
side with the feed to the opposite side.
Altering the polarization is simple physical rotation, or feeding from
an adjacent side.

Ok, to make sure I understand;
If I put the feed on the lowerhalf of the patch the antenna would be
vertically polarized?
And, if I put the feed on the left or right half of the patch the antenna
would be horizontally polarized?
Now to complicate things, I see some patches split the difference and put
the feedpoint on the left side of the lowerhalf. What does that do?
Thanks, Mike

Ah, so it is the Tailtwister. I would have thought the Tailtwister would have been bigger than that. (I wonder if it will even fit inside my Rohn 25G...)

Anyone know where I can get schematics for the control box? I emailed HyGain / MFJ to see if I could purchase one but if I can build one that'll likely be considerably cheaper...

Thanks...

I tried to do an analysis on the antenna several years ago having an LCR bridge at my disposal and basically I found an antenna built for the ham bands to be non resonant on any of the ham bands, Had an input impdance of a few hundred ohms on all the hf bands and the reactive portion of the impedance could be handled by most tuners. The relatively high feedpoint impedance probably made it radiate reasonably efficently with even a mediocre ground system.

I think the top hat may have been eithr capacitive or inductive depending on which band you were on and/or which leg of the top hat you were talking about. As I remember an antenna 10 M tall by 10M wide would tune up easily on all the bands 10 thru 80 but I am curious to what the radition patterns would look like. I would think they may not be so good on some of the bands.

Jimmie

Just go to Norm's Rotor Service FAQ
http://www.rotorservice.com/faqs.htm

14. Can I use a Ham-2 rotor control box with my T2X rotor? Are the Ham-2, Ham-3, Ham-4 and T2X control boxes interchangeable?
Yes, for the most part, all of the 8-wire rotors except for the TR-2 series are interchangeable. You can use a TR-44 series 3; Ham-M series 3, 4, or 5; CD-44/Ham-2; CD-44/Ham-3; Ham-4; or T2X control unit with any of the listed rotors or vice versa. However, the Ham-M and TR-44 series 1 and 2 rotors were wired differently and are not interchangeable with anything else. So, trying to use a series 1 or 2 control on a newer rotor will destroy the rotor pot instantly.

To be sure that you have one of the interchangeable controls, verify that the motor start capacitor is across terminals 4 and 8. To verify that the rotor is one of the interchangeable models, look for the 500-ohm pot resistance across terminals 3 and 7. If your rotor and control unit pass these inspections, they are interchangeable with others which also pass.

17. What gauge of control cable is recommended for various distances between the rotor and the control box?
On the TR-44, CD-44, and CD-45 rotors, the standard control cable includes two #18 conductors and six #22 conductors, and it's fine for runs up to about 300 feet. On the Ham-series rotors and the Tailtwisters, this cable is good up to about 200 feet. If your run exceeds these distances, move up to a heavy-duty cable, which includes two #16 and six #18 conductors which should be good for runs up to 300 feet. For more detailed information on control cables (and coax, too) contact Joel at The RF Connection.

. What is the color code for the cable connecting my rotor and control box?
The colors vary from manufacturer to manufacturer. But it really doesn't make any difference, as long as you make sure that you're connecting terminal 1 on the rotor to terminal 1 on the control box, terminal 2 to terminal 2, and so on. Also, on the HAM series and T2X rotors, you need to be aware that the heavy wires must go to terminals 1 and 2. Norm uses this color code

1. black #18 gauge 2. white #18 gauge 3. green #22 gauge
4. blue #22 gauge

5. orange #22 gauge 6. yellow #22 gauge 7. brown #22 gauge
8. red #22 gauge

3. What is the difference in the Ham series of rotors?

The Ham-M rotor was released in 1957, and there were 5 series with the last rotor being produced in 1973. The Ham-M rotor would have the series number, 1 - 5, followed by 3 digits which indicated the week and year of manufacture. For example, a rotor with the series number 5 322 would be a Ham-M, series 5, manufactured in the twenty-second week (the '22' in '322') of the year 1973 (the '3' in '322').

A Ham-M has a single-levered control box with a meter. In 1973 the mold for making the Ham-M control unit shell was destroyed in a fire. So rather than spend the money to replace the mold, the Ham-2 was born. The rotor was the same as the Ham-M, but the control unit was replaced with a three-button unit with a continuous meter reading.

In 1977 the Ham-3 rotor was released. The Ham-3 supported a new motor with an internal brake, as well as a brass motor gear. The brake wedge was redesigned, as was the brake housing, which gave the new unit a capacity for more wind surface area. The control unit for the Ham-3 supported a new PC-board-mounted meter.

In 1978 the Ham-4 or Ham-IV rotor was released. This rotor had a new steel ring gear and a reinforced upper mast support. The only changes to the control box were the addition of a new face plate, plastic top and bottom covers, and a new meter with reversible meter scales. Also in 1978 the Tailtwister rotor, commonly referred to as the "T2X," was introduced. The T2X is a Ham-4 with an even heavier upper mast support, a heavier brake wedge and brake housing, and 40 additional ball bearings. And the Tailtwister control unit has three LED's that the Ham-4 doesn't have.

> >
> Don't overlook that you can parallel two quads to get to 50 ohms as
> well!

OK, I took a mental excursion in that direction. My first thought is to use two runs of RG-62 93-ohm computer drop cable off a t-connector. This goes against my grain -- I've always hated using any t-connectors in a matched system -- but I guess the match will be maintained.

My second thought is to literally parallel them at the end of a hunk of 50-ohm cable. That feed would need to be crossed over, I think, so the fields would be additive. Easy enough to test it both ways, I suppose. If crossover is needed, what would the pattern look like without it? Hm-m-m-m ... near-field cancellation and no pattern? Pattern rotation?

Of course I will be trying this next idea even if no newsgroup answer is forthcoming: What happens if I tap off quad #1 on the side _opposite_ where I'm feeding it and connect quad #2 there? Wouldn't this additional load reflect back to feed #1 and lower its impedance toward 50 ohms? I don't know what feed #2 would be. Perhaps a jury-rig parallel line calculated to be 100 ohms would do it. (# 10 AWG wires on 5 mm centers would do it.) Phasing will be an issue.
[I probably don't have a suitable test environment to tell success from failure.]

73,
"Sal"

377. Baluns - Type 43 vs. Type 73 beads, etc.

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-13 15:19:10 UTC
From: mcclements@gmail.com
Message-ID: <1187018350.267530.276210@22g2000hsm.googlegroups.com>
Source record: 37439

A couple of questions:

1. I have some Type 43 beads that will fit over RG8X that I am putting up. The OD is about a 1/2" inch as is the length. Will this work for ~3.8Mhz and how many of those beads will I need to use? I can get type 77 in the right size, would there be any advantage to using type 77? I would like it to handle legal limit - and I would only run that if the SWR was under 2:1.

2. Why do most 1:1 baluns use that section of RG-303 coax with the small type 73 beads? Is that a teflon coax that can handle heat better?

Thanks!
Scott, WU2X

It is easier and cheaper to do phasing/matching harnesses with open
wire. Make it, don't buy it. Considering that a 1/4 wave is only about
19 inches you can make experiments with whatever wire is handy using
popsicle sticks ("craft sticks" at the craft store) and masking
tapefor the spacers.

Make a field strength meter with a diode and dipole connected to a
multi meter. space it about 30 feet in front of the quad. While
transmitting verify the elements are all working by touching each
element with a screwdriver.

Operate the transmitter at lowest possible power.

Too much fancy equipment gets distracting.

See Jim Brown's choke compendium:
http://www.audiosystemsgroup.com/RFI-Ham.pdf

He talks about the tradeoffs between the various materials and design criteria. You can look and see if your 43 will be good enough, or if you should go out and buy something else. There's a new mix, #31, specifically designed for this kind of thing.

#43 is optimized for VHF applications.

There's also the thing that materials that are good for transformers might not be good for chokes (i.e. in a choke, resistance is good, in a transformer, bad).

#43 material apparently also has a thermal runaway problem.. it gets hot, the impedance drops, more heat is dissipated, the impedance drops more, etc.

>
> 2. Why do most 1:1 baluns use that section of RG-303 coax with the
> small type 73 beads? Is that a teflon coax that can handle heat
> better?

yes
Although, one has to wonder about such an economy, since keeping the coax from melting is only part of the story. Heating of the ferrite is bad too. For #43, heating it to 60C drops the permeability by about 20-25% relative to 25C.

I've looked into this, and it's non-trivial to do in small quantities at a (ham)reasonable price. My late father-in-law owned a small company doing video and audio equipment for the broadcast industry, and one of their larger selling product was a high quality 75 ohm BNC termination. However, it took a fair amount of research on his part to find appropriate components from which to assemble them, and even so, I doubt his manufacturing cost was low enough to get to a reasonable retail price for the ham market.

FWIW, 75 ohm terminations are readily available, as a mismatch standard that might be useful. In F connectors they are available for less than a dollar, but I'd be a bit leery of their precision (1% DC resistance is easy to get, but over DC-100 MHz, a bit trickier). Good quality (mechanical and electrical) seem to run about $4-5 each.

In small quantities, it would be hard to make and sell such things for less than about $5 each (by the time you factor in mfr time, material costs), and then there would be shipping. You might be able to do better with selling a set (say, open, short, 50, 25, 75, 100, etc.) because there would be economies of scale, both in mfr and in shipping/handling.

Maybe $30/set plus shipping?

I can see all the folks going.. $30, for half a dozen connectors and resistors? I have a box of connectors out in the shack, and resistors, and I'll just fire up the soldering iron...

Considering he needs sub 1dB accuracy, this is challenging..it would
work if you assume your RF probe never needs calibration and is stable
over the environmental range of interest. Not a trivial thing to do.

A diode and a voltmeter certainly won't do it. (A typical diode detector
might vary 1 dB over a 20 degree C range.. judging from the Krytar 700
series data sheet I have sitting here. Granted that's a microwave
detector (100MHz to 40 GHz), but I'd expect similar from most other
diodes. I've given the link to an Agilent Ap note that describes various
detectors in excruciating detail.

A diode, voltmeter, and temperature sensor might work, though.

For a temporary (few week) installation?

Nylon degrades in UV
Nylon is quite stretchy, so you'd better be willing to tolerate a lot of
deflection under load.
Nylon is challenging to attach without severely weakening it (i.e. you
can't just tie any old knot)

OTOH, if you're talking about using something like 11mm static climbing
line and a short tower, you'll probably survive.

Run the calculations and see..
Make your own risk assessment..

Your guys attach about halfway up, so you've got a situation where
there's a fair bending moment on the tower, as well as the usual
compression loads on a guyed tower. Bending loads are bad, because they
tend to aggravate the existing tendency to buckle.

Sure.. but what you describe is an anecdote, not an analysis. Compare
the kinds of rope (polypropylene vs polyamide (nylon)) and their
respective strengths, aging properties, and elasticity. Compare the wind

loads and their distribution, etc.

The short answer is "probably".. how close to "sure" do you need to be?
A temporary tower in the middle of a cow pasture for a weekend is a lot
different than a permanent installation in a suburban area.

Seems like modern RF detector ICs offer much better stability than
diodes. An AD8302, for example, has a typical +/- 0.25dB variation
from -40C to +85C, with a -30dBm signal level. The temperature
variation could be calibrated before installation; if necessary, an
especially temperature-stable part could be selected from a batch.

Then knowing the ambient within 20C would be sufficient. You'd need to arrange sampling at a low level, which could be a well-constructed 90 degree hybrid. With two channels in the AD8302, you could even monitor antenna reflection coefficient (including angle), and be aware of changes there. Analog Devices and Linear Technology both seem to be strong in the RF power monitor IC area.

Cheers,
Tom

or, even simpler, what about a resistive tap (or a pair of resistive taps separated by a short length of transmission line). If you're sending, say, 100W (+50dBm) up the wire, and you want, say, -30dBm out, you need a 80 dB coupler. Or, something like a 50k resistor into a 50 ohm load will be about 60 dB down, and you could put a 10-20dB pad in before the detector. Calibration would take care of the coupling ratio, although, you might want to be careful about the tempco of the resistor. With two channels in the AD8302, you could even
> monitor antenna reflection coefficient (including angle), and be aware

Those are truly nifty parts, and form the basis of some very interesting ham products over the past couple years (like LP-100 vector wattmeter and various ham-oriented VNAs). What would be very cool is if AD would combine something like the 8302 and the A/D so it would have a serial digital output. Pretty close to a powermeter on a chip.

Functionally, this would be close to what you get with a Rhode+Schwartz NRP series, a Boonton 52000, an Agilent U2000

I have a chance to buy a used two element linearly loaded "shortie-fourty" beam at a low price. It is a KLM 40M-2B. I am a CW only operator, so bandwidth isn't of much concern to me. I would be putting it up at 75 ft.

I would like people's general opinions about this beam compared to other two element loaded 40m beams. Are there any endemic shortcomings with the KLM beam (other than the company is out of business - M2 now gives some support)? Do the lexan element-to-boom saddles hold up?

Thanks - Jeff - KA9S

Yes to both.
A corner-fed patch is roughly circularly polarized...I say roughly
because there are some other pertubations typically made to force the
sense of the CP, and also to improve the circularity.
But if the feed is just offset a bit (like 1/4-3/4 rather than
1/2-1/2)...well that should act similarly to an offset-fed dipole, so
you'd have higher input impedance and some feedpoint reactance. And
the pattern linearity would be more elliptical (patches typically have
relatively high crosspolar response anyway).

My next trick is to put 4 Patch antennas on one plate, I'm looking for the
proper
spacing between Patches. My guide at this point is this site,
http://www.darc.de/distrikte/g/T_ATV/Hybrid-Double-Quad-Array-GB.pdf
the author puts 4 biquads on one plate with proper phaseing and impedance
matching.
The author uses .8 wavelength vertical and .9 wavelength horizontal
spacing betwen centers.
I'm thinking 1.0 wavelength between centers is correct, but open to some
correction factor
for some (unknown to me) characteristic.
Any help and leads appreciated,
Thanks. Mike

patches are tough to do a *good* job on with a MoM wire type code (such as NEC, EZNEC, etc.).

A good start is to make a grid of wires, say, 21x21 wires, with the wire diameter chosen so that the surface area is comparable to the gap (that is, if the wires are d cm apart, the wire diameter would be d/pi cm.

Obviously, this breaks down horribly if your microstrip is spaced very close to the ground plane and you use few wires.

You could also download Pozar's free microstrip patch program. PCAAD 2.1 from http://www.antennadesignassociates.com/
Old, DOS style, but works

You can space patches quite closely or far apart. It typically depends
on how hard you want to work on your feed network, because closer
spacing increases the mutual coupling, which makes it harder to get the
right phasing. OTOH, spacing them too far apart gives you grating lobes

in the pattern. 1 wavelength is quite far. Consider, for instance, that most patch antennas are on some sort of substrate with an epsilon>1, so the actual patch size is substantially smaller than a free space halfwavelength. If your substrate epsilon were, say, 2.2, then the patch would be roughly 0.5/sqrt(2.2) or about 0.34 lambda(freespace) on a side. At this size, spacing them on half wavelength centers would be easy.

Some other aspects that might drive how you lay out the patch array is how you intend to feed them. If you're feeding them with a microstrip on the edge, then you have to find room for the feedline on the top and the feed network. If you feed them from the bottom (probe feed) it's a bit easier to build your feed network on the back side. You can also slot feed the patches.

The patch I'm building uses an air dielectric so I'm using about .47 Lambda
on a side.
This site is my guide; http://www.rc-cam.com/gp_patch.htm
I'm feeding with coax thru the backplate with the center conductor to the
Patch. (probe feed)
Since the Patches are 0.47 Lambda, 1.0 Lambda spacing would leave 0.56
Lambda between Patches.
Probably to much. At 0.5 Lambda the patches would almost touch. Probably to
close.
So it's between 0.5 and 1.0 Lamda.
What criteria do I use to choose the spacing?
I looked at this page and it shows 0.2, 0.3, 0.4, and 0.5 Lambda
http://images.vertmarkets.com/CRLive/files/downloads/d8b73730-e4b8-42c0-bf2a-ee52b24f02d1/
OrbanArticle5a.pdf
Although for my antenna I think those numbers should be doubled, (0.4, 0.6,
0.8, and 1.0 Lambda.
What criteria do I use to choose the spacing?
Thanks, Mike

Hi all, I recently picked up some 5 ft fibre glass antenna blanks complete with the 5/16" base fitted from a hamvention. I thought I might have a go at making a 2/70 cm mobile whip from one of them. I have trawled the net looking for design info or construction plans, but so far nothing has surfaced. Does anyone know of any web sites that may help in this quest. Alternatively are there any magazine articles around that i can look up. My work has an extensive library of amateur radio magazines, but some pointers to which magazine and year would save me a lot of searching.

Many thanks for looking

Hi.
Well after many years (over 50) as a Ham I still reckon the Z match
tuner the best.
In its original form it was designed for 10/80 metres but there is no
reason why you couldn't scale the parts for 160.
It will match from 50 Ohms coax to anything from 20 Ohms to 1500 Ohms
balanced and tune out quite a bit of reactance too. And all this with
only 2 controls.
I have used one with a G5RV 102' doublet for many years and have got WAC
and DXCC with never more than 120 watts.
Other tuners I have tried require hard to get variable inductors and
even then can do some fairly nasty things to your Final if well out of
whack. With the Z match you can calibrate the dials for a particular
antenna and reliably get a reasonable SWR straight off.
The old RSGB amateur radio book has a circuit and it has been published
elsewhere from time to time. I'm sure a Google search will find it OK.

Hi Jim,

Unlikely.

With parasitic capacitance at a meager 1pF across the 50K, its Z at
10MHz would compromise the attenuation presenting closer to 50 dB
down. At 1Ghz it would plunge like a rock. This, of course, presumes
a 1/4 watt resistor.

A better solution is to use surface mount resistors where the
parasitics are down at 100aF - but then you will have a frequency
dependant divider unless you can guarantee that the parasitic
capacitance of the 50 Ohm resistor is 100pF (sort of casts us back
into using a 1/4 watt resistor with a padding cap). At 1GHz, it is
not going to look like a trivial 50K load anymore.

A Pi attenuator will do it better.

...

The OP said this is at 1GHz. It's really tough to get a reliable resistive divider at 1GHz, with that sort of ratio. Actually, a capacitive divider probably stands a better chance of working, though getting that really right isn't trivial. (We used to worry about variation in humidity and atmospheric pressure affecting the dielectric constant of air, in using a capacitive sampler...though admittedly that was for work to a level well beyond 1dB accuracy.)

I am rather fond of the coupled-line hybrid idea: it can be built in a way that everything stays ratiometric, so the coupling ratio is very nearly constant over temperature, and of course the directionality lets you observe things you can't just from monitoring voltage at a point. It's possible to build one with low coupling without too much trouble; -60dB coupling isn't out of the question, for sure. I'm imagining a design I could make reliably with simple machine tools that would work well for the OP's application: 100 watts at about 1GHz as I recall in the through line, and coupling on the order of -60dB to get to about -10dBm coupled power and have negligible effect on the through line. There's a free fields solver software package that will accurately predict the coupling, and with the right design and normal machine shop tolerances the coupling and impedance should be accurate to a fraction of a dB and better than a percent, respectively. Perhaps I can run some examples to see if I'm off-base on that, but that's what my mental calculations tell me at the moment.

Cheers,
Tom

100aF??? :-) X(100aF)/X(100pF) = 50k/50 ??? ;-) ;-)

Hello Mike,

As Jim wrote, Patch Antennas are tough with wire-based codes.

In NEC you are limited to Patch Antennas without a dielectric layer, so deformation of the radiation pattern because of radiation from the dielectric will not be shown.

I assume that you start with simulating above a perfect ground. In that case start with grid size of about half the distance between ground and your patch. Use a grid instead of parallel wires. Parallel wires do behave different from a grid when you may expect current flowing perpendicular to the wires (for example close to the feed point).

Use a wire radius of about 20% of the grid size. This results in a wire radius of 10% of the distance between grid and ground. Run your simulations with varying grid size to evaluate the effect of grid size on accuracy.

You may have a look at sonnet lite (www.sonnetusa.com) when you are interested in input impedance and matching only. With sonnet lite you cannot get radiation patterns as far as I know.

I hope this will help you a bit.

Best regards,

Wim

<j.jmartes@verizon.net> wrote:

> I consider "return loss" to be a ratio related to the mismatch of the load
> to the line. A short on the end of a low loss line will have high Return
> Loss. You probably did some math that isnt apparent in the statement "I am
> assuming that 1/2 (of 6.75 dB) is the actual loss". .

Hello, and you don't have to "consider" what return loss is. At an interface/boundary it is the ratio of incident power to reflected power. Mismatch loss is the the ratio of incident power to that dissipated in the load at the interface/boundary. These losses in terms of VSWR are given by

RL (dB) = 20*log(S + 1)/(S-1)

ML (dB) = 10*log(S + 1)^2/(4*S)

where S is the VSWR and logarithms are to base 10.

A lossless transmission line fed at one end and ideally short-circuited on the other end would display a feedpoint impedance that is totally reactive (no resistive component). If a resistive component is present it must be due to dissipative loss in the line and since power has to travel to the load (short) and return to the feedpoint this resistance must be twice the dissipative loss in the line.

The challenge here is, given a transmission line of certain physical length, to find a measurable value at the operating frequency(s). An RF signal source with a surplus (but in proper operating order) General Radio (Genrad) impedance bridge is good for this type of measurement. Keep in mind that any coupling from the line to nearby structures will affect the measurement. Sincerely, and 73s from N4GGO,

Gentlemen, I ask for your assistance in identifing some mystery
"Boxes" that are popping up
in my neighborhood. I can offer you the following, and there are also
pictures:

There are 2 slightly different models, they vary in where the vent is
located.

All boxes have 3 connections: Power, antenna, and some sort of other
connection - phone, or
perhaps fiber.

No one asked the city communications department or the city attorney
for permission to install
these. They also would like to know what they are.

All have a fan inside that is running.

The devices were manufactured or owned by Nextel. (See pics.)

The antenna looks to be 800 Mhz.

Here are the pics:

Terry:

While I can appreciate the citys' interest in these; why would anyone ever have to get the cities permission? If the device meet/exceeds FCC specs and "they" obtained the power companies to use their (our) pole for mounting, it should be out of the cites authority.

Perhaps a call to the power company who maintains the pole would develop some information?

I have no idea of what this device is; a guess would be the best I could venture. However, my interest, most likely, meets or exceeds the cites ...

A resistive 30dB tap into a 30 dB pi attenuator, or something like that?
That would get the resistor in the tap down to a reasonable value..
and, as you point out, at 1 GHz layout and component selection would be
critical.

I suppose if you're building a circuit board, a small parallel line
coupler would work just as well, and probably be easier.

in any case, the use of those nifty parts from AD does open up a lot of
interesting applications.

Actually, the exact coupling ratio probably isn't important in this
application, because it could be "calibrated out". Stability would be a
bigger concern, and it's certainly possible to design a coupler that is
very temperature stable by choosing the right dimensions so that things
change in the right ratios.

Are you concerned about grating lobes?
How much work do you want to go through to calculate or measure mutual
Z, so your feed network works?

Far apart reduces mutual coupling, so you can use a simple feed network
(i.e. power divider and equal length lines), but gives you grating lobes.

You have to calculate the pattern of your array (you could start with
the pattern of an array of isotropic elements, and then just multiply by
the pattern of one patch, which is typically some sort of cos(theta)^n
looking thing..

If far apart gives you an ok pattern, then go with it. It's easier,
although bulkier.

Bingo. It's that ratiometric thing that is a big plus for stability.
In a coupler made of all the same metal, or at least metals that have
nearly equal coefficients of expansion, the ratios stay the same, and
it's the dimensional ratios that establish the coupling and
impedances, not the absolute size. Actually, the change in length
does matter, but if you make the assembly a quarter wave long, the
d(coupling)/d(length) is zero at that point anyway. In any event, I
suppose the thermal coefficient of expansion of metals you'd be most
likely to use is small enough that you'd be fine with a shorter
coupler. There doesn't need to be anything terribly complex about the
geometry of the whole thing, either. It's probably safe to say that
changes in the dielectric constant of air due to air pressure and
humidity aren't going to be significant in this case. ;-)

Cheers,
Tom

Given that Nextel is involved, and that they're a cellphone provider
which makes extensive use of 800 MHz spectrum, I would guess that
these are "micro-cell" base stations. These are small-footprint
cellphone bases which are used to improve cellphone connectivity in
areas where the signals from the larger cellphone towers can't reach
(due e.g. to topography, or lack of ability to find a location to put
a good tower), or to provide connectivity into the insides of buildings.

Googling around a bit indicates that Alcatel-Lucent has just recently
announced a new generation of these... their CDMA Base Station 2400.
I have no idea of that's the specific model shown in these pictures.

I agree with Dave. In retrospect, those boxes do look a lot like a
miniature version of the remote "repeater" type cellular stations that the
cell-site operators use. Also, that antenna does look like standard
moderate gain 800MHz antennas.

Tom, I thought this thread concerned measurement of attenuation in transmission lines. On the 11th I posted a
precedure that involves measuring the line input impedances with the line terminated in both a short circuit
and an open circuit, then plugging the measured data into a BASIC program that outputs the attenuation,
complex Zo, and electrical length. My thoughts were that this procedure gives results with more accuracy and
precision than the procedures discussed before my post appeared.

However, I noticed that my post drew zero response. Is my procedure out-of-line, or out dated?

I haven't tried it, and it might have horrible other side effects, but
one might be able to use NEC4, and bury the ground plane slightly below
the surface, setting the soil properties to the dielectric properties.

Or, use insulated wires...

I hope my 50 ohm patches stays 50 ohms, so I guess I they need enough space
so
they don't have much mutual coupling. (I want my cake and eat it to) :-)

I'm quite confused at this point, I'm going to build one using the spacing
at
http://www.darc.de/distrikte/g/T_ATV/Hybrid-Double-Quad-Array-GB.pdf
But instead of the Biquad antennas, I'll use the Patches.
I'll build it and see if the come, (the RF waves that is)
Do you think 0.45 Lambda is far enough so that mutual couple won't affect

the input impedance?

Hi Walt,

Well, yes, the original posting asked if it was reasonable to check
the line attenuation with the other end of the line open and/or
shorted. I think that part of it got hashed out pretty well early on,
before your posting. If I'm not mistaken the OP has a VNA he can use
to do the measurement. By sweeping over a narrow frequency range
(about 200 feet of line; he's interested in the loss at about 1GHz),
he can easily and very quickly see the line impedance and the return
loss. If he's worried about his VNA calibration, I suggested he get a
couple calibrated attenuators that bracket the return loss of his

line, which he has to check occasionally. We just don't ever see much change in attenuators from reliable vendors, from one check to the next.

Beyond that, we got into some "basenote drift" along the lines of "how can you provide reasonably cheaply a way to continuously monitor the performance?" That's where the stuff about putting something up the tower to pick off an RF sample came in. Since your posting appears as a response to one of mine where I was writing about the top-end monitoring, that may be an additional reason it didn't generate any responses. On the top-end monitoring, I claim that it's not all that difficult to make a stable coupled-line hybrid with very low coupling, and combine that with one of the modern RF power monitoring chips (esp. the AD8302 which has good temperature stability, and can tell you the phase relationship and amplitudes of two signals) to look at either just incident nom. 100 watts of power, or both incident and reflected. With something like that in place, you'd have added peace of mind on a continuous basis that everything was behaving as it's supposed to. It's reasonable to ask if there's much benefit beyond just monitoring the forward power at both ends of the line, but it seems like a small incremental effort to add a reflected measurement if you're doing a forward one. Of course, even continuous monitoring of the forward power at the top end may be well beyond what the OP has in mind.

Cheers,
Tom

The MFJ259 antenna analyser can measure coax loss at any frequency
between 1.8 and 170 MHz.

Later on in the thread, the OP said he has an Agilent network analyzer, presumably a VNA, and an HP power meter. Certainly the VNA, connected to the feed end with the tower end open or shorted, swept over a fairly narrow range (since he has 200 feet of line) around 1GHz, should tell him enough to characterize the impedance and the loss. He indicated that he's happy with that solution, some time back in the thread.

Cheers,
Tom

I don't know about the other objects, but in picture #9, the oval object is
a "turning web".
They are used when you have to reverse the direction of a cable, but keep it
on the same line.
The radius of the web is larger than the minimum radius the cable can
handle.
It keeps the wires inside the cable from flexing too much and breaking as
the cables direction changes.
This may or may not be a part of the "mystery box". It is probably part of
the local Telco physical plant.

Having a power sensor at the top of the tower would mean that it would have to be calibrated at least annually. This would be deafeating the purpose of the investigation. The purpose being finding an easier method with acceptable accuracy of measuring the loss of the cable. Initial test taken by the enginnering staff show that this may be feasble and possibly even moe accurate than using the current appoved method.

>
>What do you all think of using heavy duty nylon rope instead of wire for
>guys?

I use it in areas where the stretching and elasticity is not a problem
such as guying to the middle of my AV640 vertical which is on top of a
40 foot tower. I put them up knowing they will stretch a *LOT* and
have to be re tightened several times in the first couple of weeks.
>
>I have a Rohn 25G up 50 feet with a 2M/220/440 vertical on a 10-foot mast
>on top of the tower. It is guyed at 30 feet with standard steel guy wire.

"Standard steel guy wire" is a pretty broad statement, but without a
whole lot of information. Steel guys vary from soft steel to the
Extra High Strength (EHS) that ROHN recommends. The steel guy wire
sold by Radio Shack can be pulled in two with just two men pulling.
I've done it. Galvanized wire rope is much better and easier to work
with, but it still has less strength than EHS or Phillystran.

>I was just up the top of it two days ago installing the vertical, and it
>seems rock solid.

I would not use Nylon rope on a tower as it would allow too much
flexing should you get a strong wind before the rope has aged and
finally taken a set. Nylon is not UV proof, but it will last a few
years.

You essentially have a 60' system and ROHN recommends two level guying
using 3/16" EHS steel tensioned to 400#. That means it's probably
4000# working strength or the same as HPTG40001 Phillystran

Even going to the 50' tower they still say guying at two levels with
3/16" EHS at 23 and 45 feet. With the array on top of a 10' mast I'd
put the top set one foot below the top of the tower and the other at
roughly 27 or 28 feet.

Why not use Phillystran (http://www.texastowers.com/philly.htm). I
use it on a 100' ROHN 45G with a very large array on top.
You could use the HPTG12001 which is 1200# test at 45 cents per foot,
or the HPTG21001 which is 2100# test at 59 cents a foot. IF the
loading is light and you don't live in a high wind area.
Don't forget to tension the guys at 10% of their working load.

http://www.rogerhalstead.com/ham_files/Tower29.htm
The tower is guyed at three levels using Phyllistran HPTG40001 @ 4000#
test at 32 and 68 feet and HPTG67001 @ 6700# test at 97 feet.(IIRC)
http://www.rogerhalstead.com/ham_files/Tower30.htm The bottom set of
guys is almost impossible to see.

Note the bend in the AV640 due to the strong winds when the photo was
taken. The Nylon guys are in place. It had only been up a month or
so. That tower has since gone through a game of "musical sections"
with the top and base sections being replaced and a straight section
added above the base section to make 40 feet.

>
>Now my next project is to put up a 3-element tribander, and while my guess
>is it'll probably be OK without any additional guying, the paranoid in me
>says "hey, bozo... put up another set of guys!".

A lot depends on the current installation, but you have the VHF/UHF
array at 60 feet. Being 10 feet above the top of the tower that is
quite a bending moment although to do that I'd assume you have the
rotator down inside the tower.

The SWR at the source is lower than the SWR at the
antenna due to losses in the transmission line. 200
feet of RG-58 used on 440 MHz will indicate an SWR
very close to 1:1 at the source no matter how reactive
the load at the antenna. On a normalized Smith Chart,
the SWR "circle" is really a spiral with an end limit
of Z = 1.0 + j0 in the center of the chart.

437. W8JK station on the air

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-15 13:41:13 UTC
From: Bob Dixon <dixon.8@osu.edu>
Message-ID: <dixon.8-CFDC1C.09411315082007@charm.magnus.acs.ohio-state.edu>
Source record: 37351

The callsign of famous antenna inventor John Kraus W8JK will be in special operation from now thru Aug 25. The John Kraus Memorial Amateur Radio Club now has that callsign. In addition, today is the 30th anniversary of the discovery of the famous WOW! signal by the Ohio State University Radio Observatory, so the callsign used is W8JK/WOW.

There is also an announcement on the ARRL web pages, under special events. QST inadvertently left it out of this month's published special events.

Operation will be intermittent, primarily evenings and weekends, and more so during the Ohio QSO party on Aug 25. Announcements will be made on the DX cluster occasionally when the station is on the air.

Complete information about this operation, the club station, the WOW! signal and the OSU Radio Observatory can be found at http://www.w8jk.org and the links there.

Please forward this information to anyone you feel would be interested.

Thanks!

73,

Bob W8ERD, W8JK club trustee

Mike

The VSWR meter is showing power reflected back down the line to the meter. If the line is very lossy, like a long length of coax that has been penetrated by water, the reading may well show 1:1 but the radiated power will be zero. On its own, the VSWR meter provides a very useful indication that the antenna system is matched to the output of the transmitter. It is not a guarantee that the system is actually radiating a signal. A simple field strength meter will give an indication that the power supplied via the feeder to the antenna is actually being radiated rather than absorbed.

Cheap VSWR meters can be quite inaccurate when presented with loads which differ from their design impedence. Used with an understanding of their limitations, they are fine for everyday ham use, but something a bit more sophisticated is needed for serious antenna system measurements.

Mike G0ULI

amdx wrote:

> Is it possible for a VSWR meter to read 1 to 1 with reactance at the
> antenna?...

The vswr is determined by the absolute value of the reflection
coefficient, being defined by:

```
1 + |ro|
vswr = ----------
1 - |ro|
```

where the greek letter "ro" indicates the complex reflection coefficient

```
Z - Zo
ro = ---------- .
Z + Zo
```

So the one and only case in which we can have unity value for vswr is
when |ro| = 0, or perfect match. In a * lossless * transmission line,
the vswr is the same in every point of the line (this is an easily
demonstrable general result, it comes right down from the above
expression), so (with normal lines) the answer is definitely no :)

Of course, as correctly pointed out by Cecil, in a lossy line the
reflection coefficient decreases as you move along the line away from
the termination, and the same happens to the vswr, so that a long lossy
line may simulate a good matching also when the matching isn't even near
to good (btw, using a lossy coax is an often used trick (especially in
microwaves), when you need to give to the generator a seemingly good load).

Well, I have been told the tennis racket shaped can serve as a turning
web, and in CATV systems it sort of a
"slack eliminator" because solid core cable expands and contracts
differently. I also think that the boxes are too close
together in some parts of the city to be mini cells, although I must
admit that is what I thought they are at first.
The scary thing is that the antennas in some locations are extremely
close to 13,000 volt lines. Oh, and I mentioned the
communications department and the city attorney because I just happen
to know them both. Thanks for your time,
Stuff like this just piques my curiosity.

Good afternoon, Roger.

The VHF/UHF "array" is merely a vertical, Diamond X3200. I'm quite certain it and the relatively thin wall mast supporting it will break LONG before the tower does even with no additional guying.

However, today I started thinking about maybe putting up a 2-element SteppIR, mostly because I need to operate on MARS frequencies that are a ways outside the 20-meter band. No doubt that becomes a whole 'nother ballgame. I'll start a new thread on that topic.

As others have pointed out, unless the line is lossy, the answer is
no.

Here is a way to calculate SWR from R and X without the complex
arithmetic. It is taken from 'Reflections: transmission lines and
antennas' by Walt Maxwell, 1st ed, page 23-5, or 2nd ed page 'appendix
3-1'.

Let r = R / line impedance
Let x = X / line impedance

b = (1 + r*r + x*x) / r

SWR = (b + SQRT(b*b - 4)) / 2

The minimum value of b is 2 when r = 1 and x = 0

The minimum value of SWR is 1 when b = 2

Hence it can be readily seen that any reactance will cause the the SWR
to be greater than 1 at the load..

Just to complete the maths,the modulus of the relection coefficient,
ie mod(p),
= SQRT((b-2) / (b+2))

Source record: 37357

Today I started thinking about maybe putting up a 2-element SteppIR beam rather than the 3-element tribander I was considering earlier... main reason for this is the need to be able to operate on MARS frequencies that are a ways outside the 20-meter band, too far outside to use normal triband beams.

I'm wondering if the 2-element SteppIR (30 lbs weight, 4 sq. ft. area) with a Mam-II or Tailtwister rotor (turns out I have both) will be suitable for my 50-foot Rohn 25G.

The tower is currently guyed at 30 feet with heavy-duty stranded steel guy wire (the real stuff, not that flimsy stuff Radio Shack sells) and I'm planning to add another set of guys at the top perhaps using that Phillystran (gotta look that stuff up and learn more about it...).

Do any of you have experience with the 2-element SteppIR and if so, how do you like it?

It seems to me that the boom is mighty short at only 57 inches (1.44 meters). That spaces the elements less than 1/10 wl apart at 14.2 MHz (actually only about 0.07 wl) which seems way too close to me.

Contrary to what I see in other postings, yes, sure it could. This is very easy to see on the Smith chart. Consider that the meter is calibrated to 50+j0 ohms (which, by the way, it's not guaranteed to be "out of the box" when you first get it!). Consider that connecting the 30+j40 ohm load to the meter are two sections of lossless line. The section connected to the load is 42.1 electrical degrees of 45 ohm line, and the section from there to the SWR meter is 87.7 degrees of 82.5 ohm line. That gives you 50.03-j.01 ohms presented to the meter. Note that 45 ohms is within 10% tolerance of 50 ohms, and 87.7 is a poorly-made 75 ohm line that's out of tolerance. Hey, copper has gotten expensive, and the manufacturer is scrimping to save a few bucks.

Likely the meter is NOT calibrated to 50 ohms, and that would allow a different set of line impedances to achieve a match. With some loads, you only need a single section of line the right length. For example, if you said your meter was calibrated to 50 ohms, and the load was 67+j28 ohms, you'd get a 1:1 SWR reading with 42.6 degrees of 75 ohm line. Note that the actual SWR on that line is NOT 1:1. SWR meters tell you the line SWR only if they are calibrated to the line impedance. Reg Edwards always used to rail against calling them SWR meters, but to me, the name is fine if you understand the need for calibration, the need to apply them properly.

Cheers,
Tom

The reason the question arises.
I've build a 2.4Ghz Patch antenna. It has gain. I move the feedpoint to
change the
input impedance. Now it has more signal strength, so I move in the same
direction again
and it shows even more signal strength, 2 more adjustments more signal, 1
more move
and signal strength looks like it's starting to go down in signal strength.
(These moves were about .060" each.)
Now I see a VSWR meter at http://pe2er.nl/wifiswr/
I wonder if this can help me get a handle on adjusting for proper impedance?
The reason I want 50 ohms is because I want to build an array of 4 Patches.
The 50 ohms is important to impedance matching with 1/4 wavelength coax.
I'm using this site as info for the matching and connections.
http://www.darc.de/distrikte/g/T_ATV/Hybrid-Double-Quad-Array-GB.pdf
Yes, I'm using Patches instead of Biquads.

Thanks, Mike

PS. What do you think about the antenna spacing?

So now the problem I don't know what the input impedance is.

Don't say "It seems." Run it on a modeling program, but remember it is only tuned for one frequency, you can tweak it for gain or f/b. I think if you don't need any bandwidth (well at least no more than 3 KHz) you can do quite well with a short boom.

When you consider a SteppIR you need to throw out the old conventional thinking, ecause you have the flexibility to reconfigure the elements the way you want them.

I have a 3 element SteppIR. It is on a 16 ft boom. My HyGain 4 ele on 20 and 5 element monobanders on 10 and 15 had cleaner patterns than the SteppIR, but they were 1.5 times as big. And they didn't work 12 and 17 meters.

Oh, there's always a but,
I cut the foil to the antenna in a wifi adapter and soldered a 2" piece of
coax to the
foil and ground, my Patch is at the other end. The wifi adapter is a dongle
mounted
at the antenna. See Picture at;
http://www.tp-link.com/products/product_des.asp?id=47
Now the question is: Is the wifi adapter output really 50 ohms? If it's
not 50 ohms
then I need not attempt impedance matching with 1/4 Lambda length coax.
I searched for several hours looking for specs on the RF chip in the wifi
adapter
without any success.

> Richard Clark, KB7QHC

I don't mind waiting, I don't have any parts for the VSWR meter.
(I was looking for confirmation that it would be useful.)
Regarding the spacing; The literature I've seen shows spacing of
0.2, 0.3 or 0.4 Lambda before grating lobes form. But the Patch is 0.5
Lambda wide so you can't get them closer than 0.5 Lambda.
Here's one source;
http://www.orbanmicrowave.com/The_Basics_of_Antenna_Arrays.pdf
At this point I have a working Patch with good signal strength, so now I'm
just trying to see if I can improve on it, The project has got complicated
because
the only measurement tool I have is the software signal strength meter that
came
with the wifi adapter card.
Thanks for your input,
Mike

Source record: 37369

I have done some more work on modelling coax traps...

The article I wrote in March proposing a transmission line explanation for the operation of the traps has been revised to compare some of the alternative explanations to the transmission line explanation, the article is at http://www.vk1od.net/coaxtrap/index.htm .

Bringing it all together, another article at http://www.vk1od.net/coaxtrap/8040.htm designs an 80/40 trap dipole using the bootstrap coax trap configuration, and models the antenna system (including trap losses) on the two bands.

Feedback on the technique, errors, flaws etc are welcome.

Hi Mike,

There are very, very, very few antenna designs that arrive out of the box with 50 Ohms Z. You usually have to manipulate something (feed point or linear loading, or coupling between elements or other radiators) to get it.

The good thing about microwaves is that you can build and test so quickly - and throw away what doesn't work. This isn't like you are making jewelry after all.

The scale of construction is one you can get your arms around at the kitchen table. If someone reliable built one and documented it enough (both of these provisos are, admittedly, built on a LOT of trust); then you don't need any instrumentation at all.

>I searched for several hours looking for specs on the RF chip in the wifi

>Here's one source;
>http://www.orbanmicrowave.com/The_Basics_of_Antenna_Arrays.pdf

Pretty tedious stuff, that. EZNEC can do it all in real time - even the free version is sufficient for your purposes. For one, don't confuse matching with the radiation lobes - those issues are separable and you can ignore matching to examine lobes.

> At this point I have a working Patch with good signal strength, so now I'm
>just trying to see if I can improve on it,

Give yourself the benefit of the doubt and just move forward - the rest is analysis paralysis.

Rick, something to keep in mind in this day and age is that synthetic guys are somewhat more at risk of vandalism, and to counter that, the section of the guy that is reachable to a person is often made of flexible steel wire rope (FSWR) where vandalism is a risk.

If you decide to use their pre-formed dead ends, read the instructions on installation including end sealing of the guy material.

Owen

Hi Rick,

You could ask the same question for any decision - just means its the
wrong question.

We could all pitch in innumerable suggestions to a variety of "won't
works" from you, and will it move you an inch away from the SteppIR?

In engineering, if you can fully qualify your question, it has the
answer built in for free (you don't even need to ask for advice).

Clearly you have made a choice and this is more about validation,
hence my response to "why should it matter about picayune details."
The SteppIR's claim to fame is being infinitely variable. You freely
twist knobs until you achieve a match, what you get is what you get
(sort of a SteppZen outcome, isn't it?). If you cannot adjust the
distance between elements - what more is to be said? It sucks?

Probably, but then again, not so much as to discard it as useless
because it probably works better than a dipole. Even if it works only
as good as a dipole, it's resonant and rotatable. If that isn't good
enough, then you are buying a pig in a poke.

The real question is, do you know the performance of the SteppIR at
the frequency of your choice? If not, then it is an expensive pig in
a poke.

To this point, you have through various threads identified you need to
be frequency agile and quick. Myself, I haven't seen many choices you
have lead yourself toward that really qualify in that regard - so I am

suspicious of those qualifiers. The SteppIR certainly doesn't even come close to the span of frequency you've identified (2 MHz to 20MHz), and you are beginning to accumulate quite an antenna farm as it is.

There are an infinite variety of antennas, and some actually do achieve exactly those criteria but you hedge away from them and space considerations seems to rise here. It would seem you have to come to terms with space restrictions and those choices left are going to have some pain involved. You may achieve frequency agility, but not speed, and not for cheap.

You want to try again? When I was teaching electronics in the Navy, we had an acronym to advise our students during tests:
RTMFQ
For the easily offended (although I didn't know many in the Nav, there seem to be some here), it should read in your case WTMFQ
Write The Meticulously Formulated Question.
If you cannot find the answer within, you weren't meticulous enough.
My bet is it will mean beaucoup bucks or you are going to shave off "must haves."

73's

Thank you very much for all of the feedback in this thread. I have
finally swapped out the original RG58U coax with LMR-400, and the
difference is phenominal. At our test location, we were getting
around 40% signal with the RG58U hooked to our yagi. When I swapped
out the RG58U cable with the LMR-400 cable, we got all the way to
100%! So it appears our yagi is working good, too, at whatever
frequency we are running at here.

Thanks again for all of the help ....

Possibly, but it is immaterial. It is probably meant to drive rated power
into a 50 Ohm load.

Stacking two 100 ohm impedance quads is electrically about as easy as it
gets. An electrical 1/4wl of any good quality coax from each antenna to a T.

50 ohm cable to the shack.

Jimmie.

Thanks. I would've thought it needed to be 1/4w/l of 75-ohm cable, but
I'll try it.

It's "your" own fault. When I complained to Google, no one else did.
When I suggested a boycott of Google, everyone thought I was crazy.

It was "your" choice, Google and their BPL, or Ham radio.
Which did you decide?

Geoff.

Oh yeah, and I forgot, but you are quite correct. They were warned;
and, they thought they knew better. But then, their history does not
reflect one of a well educated or "gray matter endowed" group ... the
few intelligent amateurs' voice were drowned out by the insane masses
... now we have what they strode towards with such determination, while
beating out a war march tune on their brass keys--amateur freqs will be
assimilated by the internet, resistance is futile ... and God seen this
was good ...

Regards,
JS

You are right to question to advice Sal.

Of course with a 1/4wl with VSWR=2, the Zo does matter.

However, Jimmie might have meant each leg to be a 1/2wl (electrical)...
close wasn't it! In that case, Zo isn't critical.

Owen

POTS phone lines are very limited. IIRC from my work with those systems,
about 300-3600 Hz. Strictly human voice range, not meant for hi-fi. Special
lines are still available for hi-fi use as audio STL's.

Hello John and all:

One of the things that I haven't seen covered about BPL, is the installation and maintenance costs involved, in a power grid system.

We all know that when a system is modified for something that it wasn't designed for that problems will surface. I'll bet money that the power grid system modification and maintenance may be have a significant cost. That was not totally covered, or audited.

This has nothing to do with the Internet or code tapping amateurs.

It has to do with some intellectually devoid engineers challenging the reality of the Nyquist rate and placing a device on the only radio frequencys that can be naturally propagated through out the planet.

This group will be beaming porn wirelessly throughout the world, what an accomplishment. They should feel proud!

Chris

No, I think the engineers are saying 'It can be done, but it will interfere...' and the bean counters look at the 'but it will interfere...' part as the obstacle to overcome (buy off). Engineers don't call the shots, the lawyers and accountants do. If you want someone or something to blame, blame the 'any profit is good' mind set of the greed heads and the politicians who obey their big campaign contributors.

'Engineer' has become a generic term. It's easy to understand why many
different professions tend to be referred to as 'engineers,' it has a
ring of technical competence to it, for now, and that's why it's
co-opted so often.

> It is frustrating when fact is trumped by the use of relentless verbiage.

Or by relentless, willful ignorance, like that on the part of the FCC
when it comes to BPL (and a few other services...sigh). The FCC has
become another heavily politicized entity run by party hacks endeavoring
```

to abrogate the rights of the little people in favor of the almighty, short-term bottom line.

Don't get me wrong, I think profits are good, but not at any cost and certainly not at the expense of future generations, expenses economic, social, environmental...

Sigh,

I engineered a remote in Chicago a number of years ago, and the
client wouldn't spring for ISDN, or equalized lines. ATT provided a POTS
line and we got 8k analog audio out of it. Then again, we were next to
an ATT store. Similar performance was observed at my condo in Heather
Ridge. Here at the house, not two miles away, I'm lucky to hit 14.4
modem speeds, and 3k audio on a good day with my POTS line.

Guaranteed performance, you're right, is only 300 to 3600Hz, and
14.4k modem speed. But real performance varies from company to company,
CO to CO, line to line. And surprisingly good audio and high modem
```

speeds, are possible with POTS technology. The instruments, themselves, are bandwidth limited. But the lines are often, but not always, much wider than the instrument. That's why, when addressing the phone with a hybrid, or repeating coil, directly, I have always been able to get passable audio on a POTS line. With AM audio bandwidth limited anyway, I could usually exceed the stations audio performance from the field and you couldn't tell we weren't using high performance lines. But that experience hasn't been limited to AM. I've been able, when lines were clean enough, to hit FM stations with audio wide enough, that the losses were ignorable. Hardly negligible, but certainly ignorable. And in at least two cases, better audio than was possible with Comrex, or with the POTS digital dialup systems out now.

It just depends on who's providing the line, and how it's routed.

BTW, equalized lines are being phased out. They're still available, but carriers are moving to make them prohibitively expensive to install and maintain, anymore, and carrier noise, which was never a problem before, is becoming a problem now. It's easier, more cost effective and requires less installer activity to drop in an ISDN line for broadcast. So carriers are really pushing that. Not that they're making it that much easier on the broadcaster. When I put in my ISDN link here at the house, I very nearly had to wire it for them.

When the Florians owned WNIB, Bill got tired of all the carrier noise, and administrative crap that went along with his equalized studio-transmitter lines, and had ATT install a second set of control loops for his remote transmitter control. Control loops are copper, unequalized, and are designed to carry control voltages, down to DC and control databus output. They're basically just twisted pair. And dramatically less cost than broadcast lines.

Bill got his own equalizers and set up his own equalized lines on the extra control loops and put his studio-transmitter audio there.

It was the sweetest sounding audio on the dial. Right up there with WFMT, but less limiting.

ATT threw a fit. Control loops are NOT for carrying program audio. Bill fought them on it. And never did return to ATT broadcast lines. He and Sonja eventually sold out to Bonneville for nearly a half a billion dollars.

Sometimes the bear gets you, sometimes bear steaks are so tasty at the end of a long ride.

We've all heard the nightmare stories and seen the enforcement actions taken against Power companies that can't be bothered to fix a broken insulator, bad ground wire, noisy transformer, or whatever that is causing havoc to hams nearby. If they do put in BPL, it will be their very own customers who complain to them. Then they have less of a choice, assuming they want to keep their BPL customers.

And they still have to run the fiber. Why don't they just try selling fiber access? Somewhere somehow we got a popular misconception that there is some sort of magic box at the power generating station that supplies internet access to the world. It ain't so.

It is a political process more than an engineering one. The idea that you "just" plug into the wall socket for your internet is almost irresistible to people who don't actually know how things actually work.

Very few things "just" work.

> This group will be beaming porn wirelessly throughout the world, what an
> accomplishment. They should feel proud!

Oh, BPL will fail, either through pure technical flopping, or the marketplace moving on. None of the arguments for it hold water. My favorite is the argument that it will provide internet service for people in remote areas where they can't get service now. Presumably they don't have service because there isn't any fiber nearby, where other BB providers pick up their signals, and distribute them.

All they have to do is run the fiber to these underserved areas. (we all do know that BPL is a last mile delivery service don't we?) Of course that means there will be fiber in the area, so the other providers can come in and beat the pants off of BPL in terms of speed and reliability.

Your Henry and directional antenna would silence a pretty big area, MK.
QRP levels have been able to knock the signals out on occasion, and a
hundred watts in a mobile can keep a lot of people safe from porn.

Note that no intentional interference applies - all perfectly legal
Amateur radio use.

Now, there is the mindset which got us here in the first place, don't you get it?

Hams are just NOT important enough to justify punishment, they simply are holding onto a fraction of the public airwaves which can be placed to much better use ... get real.

Could be ... these things have a way of working themselves out ... time will tell ... I wouldn't count on it failing though. I'd count on new technology being developed which makes it even more desirable, something shown by history as much more likely.

Frankly, I'd like to see it, would find the attempt(s) highly
entertaining. And, the solutions to such would just be icing on the cake!

I said:
>> I have a 3 element SteppIR. It is on a 16 ft boom.

The other Rick said:

>What kind of a mast or tower is it on, and what rotator are you using to
>turn it?

It's on a 72 ft US Tower crank-up, the medium sized tower, not the biggest one. And the rotator is the Yaesu G-1000SDX. No problems with either. Photos if you want them.
Incidentally, mine is shown on the SteppIR web page, showing me building it, with the tower tilted over, and in QST ads showing pine trees all around bent over from the wet snow but the SteppIR is clean. The snow did not accumulate on the slick fiberglass elements! Been up 3 years now - perfection.

Of course you realize, as BPL becomes of a major importance, attempts will be made to make the lines EMP hardened (most lines are now going underground in this attempt, as we speak), you linears will look as a matchstick held beside a 1,000,000 candle-power lamp--but then, you already knew that. You are simply in the cycle of denial/acceptance ...

How would I get fined for pointing my antenna to Europe? It legal for
me to point my antenna to Europe, run an amp, and talk all day if
I want to.
I don't run 5 KW amps, calif kilo's, or other illegal activities as
you
admit to doing. So I would expect you to get a fine before I would.
BTW, the amp is an 81 model. Yes, fairly ancient, but it has no
moths living in it. As Mike points out, I probably wouldn't even need
it to keep BPL on hold. My amp will only do about 1400w max, so
I have no fear of breaking any power level rules.
Just my 100w radio into the yagi, aimed at Europe would probably
do the job.
I have this vision in my mind of a bunch of BPL techs jabbering
away like the guy in the movie "Cape Fear" as he's drowning
in the river.. Abadabajumbalikearedoka, aubadbababababdbaba.
LOL...Kills me to ponder the scenario..
So while you are moaning and groaning about the problem, I will
be taking care of it myself in an orderly military manner.
Any problems they have will be due to their own shoddy system
design and line leakage which is a two way street I remind..
Not my gear. So they won't have a leg to stand on if they or even
you complain to the FCC.

Well, in my neighborhood/city, you could not get into any trouble. All lines are underground. What you cite is a moot point.

Except for exceeding safe rf levels, I cannot see a problem.

Anyway, BPL is best suited for remote areas (your neighbor is over in the next 40 acres), the new 700Mhz would be far more suited to towns/cities.

Isn't the real excitement watching this new technology develop, with solutions found "on the fly?"

Wasn't there a rumor a couple years back that the phone companies are
slowly discontinuing ISDN service? Or is that only for residential
services as opposed to radio stations?

They don't want to do ISDN internet services, anymore. But I'm using
ISDN as a studio-studio link. So far, no one has suggested to me that
it's not going to continue.

Question

I assembled it per the instructions for the band parts I wanted. I triple measured and Up she went.

I'm really Low (as in instead of 14.150 its down around 13.950)

And I just noticed yesterday looking up that the director seemed a bit longer than the driven.

And I know as per the first line, I assembled it to the tee for per the instruction sheet.

Suggestions ?

John Smith 1 reported Radium to write:
"Analog cell phones shoild stop using FM and should start using AM at whatever practical radio frequency available."

Tune the FM band. Recovered audio is all about the same loudness. Tune across the AM band. Even with stromg AVC action, loudness varies with signal strength.

Loudness independent of carrier signal strength is a great advantage of FM. Amateur FM repeaters allow hand helds with a few milliwatts output sound about as loud as a base station with maximum allowed power output.

Imagine a cell phone in all the disadvantaged locations it encounteres as it switches from repeater to repeater along its route. Loudness would be nightmareish. Radium`s proposal won`t be satisfactory with analog phones.

Best regards, Richard Harrison, KB5WZI

Dunno, if the director is longer than the DE, something ain't right..
Maybe a loose tube pulled out a bit or something.. ??
The director should be a little over an inch shorter than the DE.
Could be a visual illusion too though.. You will probably have to
yank it back down and re-measure. :/

Actually no, I don't. A side effect of BPL might be to harm the bands that amateurs operate on, but I can't even imagine the people who push this merde having a thought of inconveniencing Morse code lovers.

> Hams are just NOT important enough to justify punishment, they simply

HF is an unruly beast, and not well suited to any kind of distance limiting needs. Years ago there were wireless home phones around 11 meters. They didn't work too well. A large part of that was HF type problems of static, big antennas and propagation effects.

Anyone who wants to work in HF, especially digitally, will have to reckon with those effects. The political types who promote use of HF for this seldom understand that.

Of course. I don't know what makes you think I'm set on the SteppIR. I only just started considering it two days ago. And a thousand bucks really is a lot of money to me... might not be to some people.

> Clearly you have made a choice and this is more about validation,

Nope, far from it.

> If you cannot adjust the distance between elements - what more is to be
> said? It sucks?

If it sucks, then yea, that's what needs to be said.

"Probably works better than a dipole" isn't good enough to spend a big one on. As for being resonant and rotatable, that's not worth a thousand bucks (to me) either.

> To this point, you have through various threads identified you need to
> be frequency agile and quick. Myself, I haven't seen many choices you

> you are beginning to accumulate quite an antenna farm as it is.

That would be true if I had actually put any of them up. So far I have two inverted vees, one dual-band NVIS dipole, and a 144/220/440 vertical.

I have more than one need. The general need is to be able to operate on a list of CAP and MARS frequencies from 2 to 24 MHz. That one doesn't need any gain or directivity, or any specific level of power (I routinely participate in CAP and MARS nets with my inverted vee and 5 watts out of my FT-817). I'm considering the T2FD only because then I can load all the needed frequencies into the radio and put it on scan, and if someone I need to talk to shows up on one of the channels I can pick up the mic and hope for the best. But I'm not about to spend $300 for one (sorry if that sounds like I'm "hedging away"... whatever that means...).

The more specialized need requires higher power and a rotatable, directional antenna, in the frequency range from something below 20 meters up to 24 MHz, in order to be able to offer a specific MARS service. If you're in MARS you know which service I'm referring to, and if you're not, for some obscure and relatively bizarre reason I'm not allowed to say, but it's an easy guess. In any case, I have been informed that I probably

won't be able to participate with a wire antenna and 150 watts, so since it appears that's their story and they're stickin' to it, I'm looking for some alternatives that don't involve buying a whole separate antenna just for MARS.

> It would seem you have to come to terms with space restrictions

Not sure where that impression came from, either. Actually I am quite fortunate regarding space, with two acres of land arranged in a square 300 ft on a side, and lots of tall pine trees. I could put up a pair of the biggest SteppIRs, stacked, on a 150-foot tower but there will never (ever) be money available to do stuff like that, so I have to settle for what I already have, or can afford... and what I have is several random sections of Rohn 25G so that's what I put up.

> You want to try again?

Thanks, but I guess not. I'm doing my best already, to gather information and make a decision I can afford and will work reasonably efficiently for me. I'm sorry if you find my questions unclear or "hedging" or whatever but think I've been pretty clear on my questions up to now, and I've learned a lot from reading you guys.

The fact is I have more than one question (surprise!), each of which has been formulated meticulously enough, and each of which serves a different though related need. This latest one is the simple and meticulously-crafted question that says, simply, "Can a 2-element beam work efficiently with only 0.07 wl spacing between elements?". The related question, which I think is equally clear, was "Any of you guys have the SteppIR 2-element and if so, what do you think of it?".

I can't think of a way to meticulously craft either of those questions that will yield a self-contained answer on its own.

Actually, no, not everyone has to study HF to see if your argument holds
water or not.

YOU just need to see a BPL modem at work--it'll blow away any doubts you
may have as to it being suited to HS data xfer over power-lines ...

Hi Rick,

This is what I mean by meticulous (in any formulation): What "is" good
enough? One could fill a book with what is wrong with a suggestion
and we would be no nearer an answer.

>> you are beginning to accumulate quite an antenna farm as it is.
>
>That would be true if I had actually put any of them up. So far I have
>two inverted vees, one dual-band NVIS dipole, and a 144/220/440 vertical.

OK, I suppose that's another way of saying having four antennas
covering up to 6 bands isn't enough - that is why we have our own
newsgroup, because many share that feeling.

>I have more than one need. The general need is to be able to operate on a
>list of CAP and MARS frequencies from 2 to 24 MHz. That one doesn't need
>any gain or directivity, or any specific level of power (I routinely
>participate in CAP and MARS nets with my inverted vee and 5 watts out of
>my FT-817). I'm considering the T2FD only because then I can load all the
>needed frequencies into the radio and put it on scan, and if someone I
>need to talk to shows up on one of the channels I can pick up the mic and
>hope for the best. But I'm not about to spend $300 for one (sorry if that
>sounds like I'm "hedging away"... whatever that means...).

You have a need, but you are not going to spend $300 to fill it.
Again, you say what is wrong, but not what is right. Will you spend
$299? This threatens to call this portion of the game 300 questions.
So to practice the engineering form of Jeopardy: "in the form of a
question respond to 'I might spend more than $150 but less than
$300'?" (answer: "What is a binary search?" Thank you Don Pardo.)

Spending aside, a lot of performance be can be built for less if you
discount the value of your time (that is why they call it a hobby).
The trouble I have here is that you don't want to spend money (neither
would I), but then you ask about spendy items like the T2FD or
SteppIR. Say What?

I see the 2 to 24 MHz requirement trotted out, and strictly speaking
it is exceedingly obvious you won't buy that solution on the open

market for $300 or less (unless it is a bribe to a Government official
that has the power to surplus gear).

So it stands to reason you would have to build it. That can be done
to the limitations you offer above (and probably exceeding the
performance of the T2FD).

Doubling the dimensions of:
http://home.comcast.net/~kb7qhc/antennas/verticals/Cage/cage.htm
would satisfy 3/4ths of your spectrum requirement and the ambitious
amateur could erect it without too much care for precision or cost. If
you were to come back to me with a negative reply ("it won't....")
what is one to do?

>The more specialized need requires higher power and a rotatable,
>directional antenna, in the frequency range from something below 20 meters

Tell me that you want to spend less than $300 for this and we can all
have a chuckle. About the only thing that qualifies was described as
having a Gaussian Array (no suggested retail price - and for good
reason).

>I have been informed that I probably
>won't be able to participate with a wire antenna and 150 watts, so since
>it appears that's their story and they're stickin' to it, I'm looking for
>some alternatives that don't involve buying a whole separate antenna just
>for MARS.

I hope you didn't hear that story here, it qualifies as fiction in the
library. There are wire solutions that are steerable, and certainly
power is not an issue (especially if you were going to pour it into a
T2FD).

>> You want to try again?
>
>Thanks, but I guess not. I'm doing my best already, to gather information
>and make a decision I can afford and will work reasonably efficiently for
>me. I'm sorry if you find my questions unclear or "hedging" or whatever
>but think I've been pretty clear on my questions up to now, and I've
>learned a lot from reading you guys.

Your questions tend toward seeking validation:
"Will X work for Y?"

To which some responses offer
"Um, yes, but why would you want to do that?"

"Because I don't what Z."

"OK, X for Y without Z can be found with model A."

"Model A will do, but it doesn't give me B."

"OK, X for Y without Z but with B."

This can go on for a long time.

>The fact is I have more than one question (surprise!), each of which has
>been formulated meticulously enough, and each of which serves a different
>though related need.

We are up to model XY(/Z)+B+specialC, then.

> This latest one is the simple and
>meticulously-crafted question that says, simply, "Can a 2-element beam
>work efficiently with only 0.07 wl spacing between elements?".

The W8JK works quite well at 0.10 wl spacing between elements and has
been around for more than 50 years. How much can squeezing it to 0.07
spacing hurt? The free version of EZNEC can answer that in less than
a minute (none).

If you build it wrong, then the answer is no, it cannot work
efficiently.

You can even buy one that won't work for the same reason - you as a
builder of the package of bits and pieces that arrives UPS. In this
world of free competition and lead painted toys for children, you can
also buy one that won't work - irrespective of your construction
talents.

Being meticulous about "efficient" would have you expressing what loss
is allowable. By inference to your tendency to select a T2FD (loss in
the ballpark of at least 3dB), then yes (and with proper design and
construction), 0.07 wl spacing between elements is efficient (even if
it loses 1.8dB along the way in getting there). If 1.8dB is too much
loss (another negative reaction), then you weren't very meticulous at
all. On the other hand, it would serve you well to know that doing
better would probably cost beaucoup bucks more than $300 (or even a
grand).

>The
>related question, which I think is equally clear, was "Any of you guys
>have the SteppIR 2-element and if so, what do you think of it?".
>
>I can't think of a way to meticulously craft either of those questions
>that will yield a self-contained answer on its own.

Thus this newsgroup has a benefit - at least from my habit of
rhetorical excess. (a tip o' the hat to Myles for flowers.)

Your one-question-at-a-time is easy to respond to and satisfactory in
most respects, but when you combine the separate answers into this
goal of a Grand Unification Theory of MARS/CAP operation, it is like
watching someone on rubber crutches. I cringe, but laughing is one of
those involuntary reflexes.

John,

You are making some poor assumptions. I do not frequent the radio HF spectrum. While I have operated CW before, it has been years ago, largely to gain privileges to HF. I make my living in the Voip/Data world and would like to push broadband consumption like a utility.

That being said, I liken BPL to pee'ing into a stream. While I might not get my drinking water from it, someone or thing probably does. Just because BPL is not polluting spectrum I might be using today does not mean its not polluting someone else. Additionally, BPL's maximum data rate of 2 Mbps makes it late coming and soon not even considered broadband.

I do not understand why you would fight for something you probably would not even want in the future. Lets lay down some fiber, or at least twisted pair.

The facts are old, arguments for BPL vary because of their faulty logic, not the other way around.

Chris

I will investigate collecting together the parts from hither and yon and building one myself, for less (sorry, can't define "less" but, like pornography, I'll know it when I see it).

That was the objective behind whatever my original question was that had to do with T2FDs. I'm pretty sure the original question had to do with where I can buy suitable terminating resistors and bizarre-ratio baluns, and which of the various and assorted configurations (390 ohm resistor and 4:1 balun vs some higher resistance and ever more obscure impedance-ratio baluns) is "best" (which is to say, least "bad"). But if there was other stuff in my original question, please do me a favor and don't toss it up in my face, OK? Answers to those questions (which I got, both here and elsewhere) are sufficient for now.

Come on, Richard, can't you see the apples-to-oranges comparison?

I'm willing to spend $1000, if I have to, on a two element beam that claims to work efficiently from 14 to 24 MHz (and beyond), IF it works as advertised, because I have limited alternatives.

I'm not really willing to spend $300 on a radiating dummy load, because I have LOTS of alternatives including building one myself for a lot less.

That can't be hard to understand, or differentiate between the two, can it?

> This can go on for a long time.

I think it's called "doing some research" where questions beget answers that then raise more questions that perhaps weren't thought of before, until finally everything falls into place.

You want me to go away and come back with a full IEEE-STD-830-1998 requirements analysis before asking any questions. I've been doing that kind of stuff for a living for a very long time and I'm pretty sure it doesn't work that way... you ask questions, challenge the answers, come up with more questions, and eventually you end up with what you need.

Is it the fact that I tend to challenge the answers ("Ah, yes, but what about...?") that seems to bother you so much.

I'll tell you what, Richard, I appreciate the help you have provided so far, I really do, but if it's all going to bug you so much may I suggest that it's OK if you just stop responding to me? I'll miss your sage advice but I guess I'll live with that...

> Being meticulous about "efficient" would have you expressing what loss
> is allowable.

2 db loss is unacceptable if it means I can't hear the stations I need to hear, and they can't hear me.

18 db loss is fine if I can still hear them and they can hear me.

> By inference to your tendency to select a T2FD (loss in the ballpark of
> at least 3dB), then yes (and with proper design and construction), 0.07

This is what I mean. Two completely different requirements, two completely different solutions. Apples to oranges. And I have no "tendency to select a T2FD". It's one of many options. But I think you knew that and you're just having some fun at my expense, which is fine but it's over now. :-)

At the risk of sounding negative again, is it OK if I point out that one
of my early needs involved NVIS operation (it's in one of my early posts),
and verticals in general and cages in particular aren't really suitable
for that?

An interesting point! And did this underground system radiate at HF??

It seems to me that if a BPL system can be made that doesn't radiate at
HF, then I have no problem with it.

> Boy, have I got news for you!

Yes Roy, it is incredibly naive! Just another of the hundreds of false reasons why 'BPL won't affect me'.

I don't know of the situation in the US, but in Australia, a licence to transmit on a given frequency does not override another law that in a very general way prohibits interfering with a telecommunications carriage service.

So, in Australia, it may be that no new legislation is needed to silence hams who disrupt a BPL system (interfere with a telecommunications carriage service).

Some of us continue to work on objective measurement of ambient noise levels and BPL emissions to document to issue, and the risk to BPL deployments if they are held to lower emissions than they would like.

Right now I am working on documentation of a series of measurements made prior to BPL deployment in Sydney. Another series will be made after deployment, and the measurements by an EMC test house and the WIA will be considered by the carrier, the regulator, and the relevant Australian standards committee in a more cooperative environment than seems to exist in some jurisdictions.

Interestingly, the EMC test houses invariably use equipment that is not capable of measuring ambient noise levels on HF, they are just not sufficiently sensitive.

This is a worry, especially when rumour has it that ITU-R is working on a revision of P.372-8 'Radio Noise' that is likely to see an increase in expected ambient noise levels on HF. The inevitable creep of spectrum pollution. As part of our study of the site in Sydney, we will be trying to justify exclusion of the carrier's noisy SMPS on their PayTV equipment from determination of the ambient noise levels.

OTOH, we have used a Buddipole and FSM to make measurements of ambient noise levels that are not invalidated by instrument noise. An article characterising the Buddipole for use with FSM is at http://www.vk1od.net/buddipole/index.htm .

The fact remains that we hams do not well understand our operating environment, and sadly, seem to have little interest in it.

Oh well, there will probably be more development of simulators for the HF experience in the future!

Martin:

It is the house lines which have some amateurs worried, unless you have an underground home, or all lines are run through properly shielded conduit (NOT likely!), this is what worries most amateurs ...

Although I use 10/11 meters daily and 80 meters 2/3 times a week, most of my operations have moved vhf/uhf/shf. I think that is the future. HF simply servers too few to demand the consideration some wish.

I had a similar issue with an A3S that's used during Field Day. It turned out that the PVC caps on the ends of the traps weren't pushed-on flush with the ends of the traps. We found this when double-checking the overall length of the elements -- they were a few inches long, even though the intermediate lengths appeared to be correct. Make sure the PVC caps are pushed *all the way* onto the traps.

You may also experience some aberration in the resonant frequency if you don't have adequate decoupling of the feedline's shield from the DE feedpoint. Cushcraft recommends winding several turns of feedline into a coil as close as possible to the DE feedpoint. You can also use a 1:1 balun of your favorite flavor.

Much simpler solution, build 3 element quad with wide spaced elements and
you get 50 ohm impedance, good pattern/gain and simple antenna.

tunneling doesnt take faster than light speed to explain, only that there
are more than three dimensions to space. In some dimension the begining and
end was not as far apart as the scientist thought they were. In other words
you dont travel faster than light, you just take a short cut.

Jimmie

I don't care if they do or not. They most certainly would not
be able to fine me if I'm not breaking any amateur rules.
What are they going to do, shut down every ham in the area?
There are 143 hams just in my close general area which would
cover the 77096 and 77035 zip codes.. And that's a very small
portion of this town. Maybe within a 5 mile radius?
If I'm not trashing their system, someone else will be.
The FCC will be busy in this area. I suppose they will have to
shut down everyone if they want a clean BPL system.
I don't see it myself. I'd fight them on it if they pressed the
issue with me. And I rarely actually run an amp these days.
If my 100w causes them problems, I'd consider that a personal
problem of the BPL system owners. I actually don't see it
coming to this area anytime soon being we already have cable,
etc.. I don't think it would sell too well, being cable is already
just as fast or faster.
MK

Source record: 37257

Dear WA1RKT:

For less than $1000 you may purchase and use a LPDA that will
accomplish what you specify. Several such antennas are on the market or you
could construct one from scratch.

Some positive aspects of a LPDA:
1. no moving parts
2. "instant" BW so you may use the scanning you mentioned
3. using anything that is at all of a reasonable size, the antenna
inherently has low sensitivity to minor construction and other errors (much
favored in ice country because their performance degrades slowly with ice
coverage - not found to be true with a critically "tuned" yagi)
4. performance as constructed is close to that predicted with NEC -
tweaking is usually just not needed (occasionally, the shorting strap needs
to be tweaked)

Consider the conventional solution for the BW requirements you have set
out.

The StepR antennas work, but questions remain as to how well and for how
long. If I were to go on a trip to a salt-water DX entity, I sure would use
their vertical right on the beach. In other words, they are a solution to
some problems.

Good luck. 73, Mac N8TT

That statement doesn't make sense. What would me transmitting on
my legal licensed frequencies have to do with BPL effecting me or
not?
If BPL is in this area, it's going to effect me whether I transmit or
not,
if it trashes my receiver.
It's not naive. I just don't care what they think. I think it's a
lousy
system, they approved it, and now they are going to have to live
with the problems that are sure to come up. I'm not going to be
changing my operation any time soon.

>
> I don't know of the situation in the US, but in Australia, a licence to
> transmit on a given frequency does not override another law that in a
> very general way prohibits interfering with a telecommunications carriage
> service.

That would be all well and good if they used a single frequencies one
could
avoid... The way I understand it, I stand a good chance of trashing
them
no matter what frequency I'm on.
If they are worried about interference to a carriage system, they
should
not place it in the same spectrum with another existing service when
using power lines, or any other type of leaky or non shielded wiring.
What about their interference to HF radio users? Not all are hams.
Some are commercial users, such as Houston Universal Radio, which
supplies radio services for commercial aircraft. I guess they will
have to shut
down also.. I'm sorry.. I don't buy it.. It's a lousy system and it's
not my fault that it is lousy. Why should amateurs pay for this
mistake
in planning?

>
> The fact remains that we hams do not well understand our operating
> environment, and sadly, seem to have little interest in it.

How do you come to this conclusion?
Here in the U.S., according to most all I read, it's up to the
unlicensed
emitter to make sure they do not cause interference to licensed
stations.

http://www.ntia.doc.gov/ntiahome/fccfilings/2003/bplcomments_08132003.htm
http://www.ieee.org/organizations/pes/public/2004/sep/pesview.html
http://www.arrl.org/tis/info/HTML/plc/files/BPL_paper.pdf
https://www.arrl.org/forms/fdefense/
Yes, that's right. The ARRL is suing the FCC over this.
I agree with that decision 100%.

I intend to hold them to that. Being an unlicensed emitter, I think
they
should have to accept any interference that comes their way.
And not all will be hams.. What if they decide to run BPL near
Houston Hobby airport where Universal Radio is located.
Do you think they will choose BPL over commercial aircraft
comms?
I doubt it.. I don't think amateur stations should be considered
any differently, being we are licensed stations.

Myself, I think the FCC should be horsewhipped for their
performance in deciding the BPL issues.
They choose to ignore valid test data, and go with who has
the money to spend.
This is why I really could care less what they have to say to
me about any operating I might do. I'll sit right on my front porch
and tell them to bite me if they show up to complain.
They promoted the flawed technology. I had nothing to do with
it. And I have a legal right to operate on any of my assigned
frequencies without undo or unwarranted restrictions.
Imposing "quiet hours" will not help. Lowering my power
will probably not help too much if I'm using gain antennas
pointed at the offending lines, and there is no way to
avoid that if I want to work anywhere to the east.

>
> Oh well, there will probably be more development of simulators for the HF

Wouldn't it be possible to place a filter at your meter that would shunt
the BPL signal to ground for the whole neighborhood?

>for that?

A review of my response at that time offered a dipole of similar
construction in its place. It doesn't take much math (or rotation) to
shift from monopole to dipole.

There is NOTHING about a cage that makes it unsuited for NVIS. It may
be intractable, but that goes with the turf.

I wonder though about why this is so agonizing. If you work MARS/CAP,
it would seem that solutions would be there in pile-ups for the QST
tossed into radio land. That, or everyone is wandering in the
wilderness.

It is not like I haven't seen these questions about MARS/CAP asked
before, but most were satisfied with the air-cooled resistor and
didn't show much interest in efficiency (what for? there was no real
choice in the matter without several kilobucks of investment anyway).
Go to Salvation Army and buy toasters for lossy loads (they come in
1KW values for $5).

BalUn? When you characterize allowable efficiency as being between
-2dB and -18dB, then you don't even need a BalUn anymore. It's going
to cost you $1000 to rotate it (whatever "it" is). And if crisis (I
gotta hear them and they gotta hear me) drives the design, then you
have to open the wallet. Does anyone else in MARS/CAP get by with
less? In a dozen years I haven't seen a single post by one to claim
they do (or admit they couldn't hear or be heard).

You are going to have several many antennas. None are going to be
whole solutions. Some are going to be slow to tune. Some may never
tune. Some may never be heard. Propagation will be a cruel arbiter.
Guarantees won't be honored. This is pretty much the same fate in the
Ham bands, and out of band frequency doesn't alter this reality very

much.

Decide to build a farm efficiently. Select ranges of frequency
suitable to octaves, not decades. Point immovable antennas towards
your expected traffic. Or if you are filling in a network's uncovered
areas, point them in those directions (that is what a network is for,
isn't it?).

I taught HF/VHF/UHF comm systems in the Navy and served as senior
Petty Officer in CIC. There is no such thing as a single solution.

No, but one of the issues with BPL is that equipment connected to outlets
changes the configuration, and although BPL is adaptive, reliability of
full speed service at any location in a premises is not assured.

Well, there you go! I had it in the back of my head that adding appropriate parasitics would pull the impedance down. My problem was that all I had to fiddle with was the driven element and a reflector.

With apologies to Yuri, I may still try some of the stranger approaches -- simply to see what works and what doesn't.
(My approach to ham radio is like farmboys playing with dynamite, except you don't usually kill nuthin'.)

No. BPL signals are already filtered out by distribution transformers.
In order for BPL to work, there are relaying devices installed at the
transformer.

There are several systems for the last "100 feet" including WiFi type
systems.

Here in Isreal there was a BPL trial and becuase of the interference
to HF communication it was not allowed. Israel Electric took a different
approach and has wired fiber optic cable all along their right of
way. They use it for their own network, remote managment and monitoring
etc.

They can also use it for selling Internet service if approved, without
using BPL.

As for long distance wireless access, if WiMax ever reaches its claimed
potential range, it would be cheaper to install a MESH type WiMax network
on power poles. Not only would it provide rural Internet access cheaply,
it could be used to sell wireless Internet access to travelers with
handheld devices.

BTW, 2.4 gHz is not the only band for wirless services. I have several
DECT cordless phones which operate in the 1.8gHz band, interfere with
nothing, including cell phones which also operate here on that band
and have longer range than my WiFi devices.

Geoff.

The explanation depends on a particular deployment topology, but the answer
remains NO for other deployment topologies as well.

Exactly my point. The ARRL can lobby all they want, but until they can match the "campaign contributions" of the big-money boys, they'll pretty much be ignored. Money does the talking. If your "legal" operation interferes with the making of large amounts of money, either your legal status will be ignored (but you're free to sue the power company if you want), or the FCC will solve the problem with a regulatory change in favor of the ones with the money, or a little baksheesh will change hands for an "earmark" on some obscure congressional bill to make a special law just for folks like you. That's the way our system works.

Anyone who likes sausage or has respect for the law shouldn't look too closely at how either is made.

Good morning, Mac.

Yes, the log periodic was my other alternative to the SteppIR (in fact, the SteppIR was something I've been considering to mitigate the size of the LPDA). It should do well for the higher frequencies of interest (14 to 24 MHz).

At one time I considered a wire log periodic, pointing straight up, as an NVIS antenna for the lower range (2 to about 8 MHz). Then I went to lie down until the thought went away. :-)

Seems I got shot down in flames when I mentioned this very topic a couple of months ago. Or maybe it was my attempt to try and visualise how this phenomenon might take place. :-(

If optical photons can tunnel through opaque materials, then why not radio frequency photons? An antenna made completely of insulating materials would at least reduce the risk of lightning strikes. :-)

I'd say Owen, and especially Roy, are right on. If you must escape gloom at the price of ignoring truth, how then do you expect anything to get better. Lady justice might be required to wear a blind fold (these days she peeks into wallets), Joe Blow public needs to have his/her eyes wide open!

With the new 700Mhz freqs in the process of "arrangement" so that the BIG MONEY telcos get 'em and the telcos remain in control of expensive voice/data lines, and are allowed price control and use control, BPL is a sure to be attempted as an escape route.

Now you can fight this issue anyway you choose--but the real answer is to attack the beast in the heart, unfortunately the telcos are still one particularly ugly, brazen and large dragon! And of course, as Roy pointed out, these telcos are under the protection of corrupt, self-serving public servants who oppose the will of their masters (Joe Blow public.)

Now, run and hide from those fact, or not ...

You just can't pose a better question than that, it escapes me how
anyone can find fault with such a question(s).

Once we deal with the problem of rf waves appearing both as waves and
photons and get our minds wrapped around how this is (truly understand
rf), interesting things could happen.

There probably is not anything new to done with Quads but please share
your experiments with us!

Some things I discovered:
1- Quad made from copper pipe gets heavy fast.
2- It is possible to match the driven element with Gammas, hairpins &
such but not worth the bother.
3- If nothing breaks when a Quad is loaded with ice it will probably
be all right after the ice melts.
4- Maintenance will be required frequently.
5- Stealth Quads are especially hard to do.
6- Lighter and more flexible is more durable.
7- If your transmitter will tolerate it, it will radiate well off of
design frequency but the pattern will be difficult to anticipate.
8- Due to the radiator being a closed loop the receive noise will be
down from most antennas.

Hi Willy

What kind of satellites are you considering? How big is the Dish and
what frequency are you considering?
Timestep (http://www.time-step.com/) has alot of "small dish" antenna
pointing hardware and software for NOAA satellites.
NASA publishes alot of data on the position and tracking of satellites
http://science.nasa.gov/realtime/

Dear Rick:

Small (six element) LPDAs exist that have been used over the frequency range of interest by amateurs and military. The SWR tends to oscillate with frequency and the gain is reduced wrt to a larger LPDA, but they will work for what you wish to do. Perhaps I have not interpreted "size" correctly.

I have some experience with wire LPDAs that point straight up. Many years ago, a three (insert giggle) element was constructed to cover 4 to 6 MHz. Two towers. Three wires. It produced noticeable gain over a doublet. I no longer remember how high the towers were.

An aside: 2:1 or 2.5:1 frequency coverage by a single LPDA is straight forward. Larger ratios require one to consider more factors.

Perhaps one of the best antennas for covering the 4 to 5 MHz range is the classic tropical broadcast antenna. At center frequency: two one WL dipoles (fed in phase), 0.3 WL high and separated horizontally by 0.5 WL. Bring the two, equal feeds to a central pole and place them in parallel. It is possible to have a resulting impedance that is very acceptable. An advantage of this system is that the coverage is close to being equal in azimuth (at the TOAs of interest) and it has low sensitivity to distant, interfering stations.

Consider investing in EZNEC and learning to use same.

Do let us know what your antenna system ends up being. 73, Mac
N8TT

When it's a few milliwatts of BPL up against an induced signal from a
kilowatt transmitter, then the mouse is the BPL.

And, according to the regulations, if I have to run the full legal limit
to be heard over the din, then it's legitimate.

Of course in a plutocracy like the Benighted States of America, whoever
has the most bucks makes the final policy and then hires state-paih thugs
to enforce it.

Probably not. But a couple of companies, including Motorola have BPL
systems that do NOT interfere with amateur radio services at all. The
problem seems to be getting regulatory agencies to mandate such systems
rather than the sloppy ones they seem to have been bribed to permit.

When money becomes the political power, then anarchy has arrived. Ultimate
political power in an anarchy is simply feudal. That is to say, whoever
can buy the most firepower eventually gets to rule. You either bow to the
feudal lord or he runs right over you with his army. Or you get a bigger
army of your own. Those are the only real choices and don't ever pretend
it's democratic because it's not and wasn't meant to be. Lacking an army,
your only real recourse is to divine right monarchy.

==========
Here in the UK BPL (or PLC =Power Line Communication as it is called here) is not an issue since ADSL via telphone line) is sufficiently developed be it not everywhere at a 2Mbits/sec or higher speed (as yet).

I have followed ARRL's involvment in 'fighting BPL' and noticed they have tested in/around their HQ a Motorola BPL system that apparently does NOT interfere with HF comms . Other BPL systems are giving a lot of problems .
So there seem to be purely technical issues with BPL as well.
Also it seems to be very doubtful that BPL will be viable as a cost effective HS comms system considering other more viable methods like fibre or community satellite/high power Wifi systems ,the latter particularly promising for rural communities.

Hi Mike,

There are antennas made of insulating materials, why don't you have one already? However, no antenna is made "completely" of insulating material - unless you can replace a gamma feed with fiber optics at HF. ;-)

Let's say you want to work 30M Evanescent Mode (this is the coupling of their work). Build yourself a prism of glass (or other, similar dielectric with n > 1.6) with sides of 400M X 400M X 600M. Aim the long side's face into the sky - if you can move it, that is. Point your beam into one of the smaller faces. Expect a LOT of attenuation. If you want more energy going towards DX, you need to make the prism larger.

If glass is not your cup of tea, it can be replaced with a similar sized prism of a matrix of metal rods (all roughly resonant). This does, of course, present a lightning hazard.

As for the "faster than light," Your DX signal will probably arrive no sooner than it did without the prisms (the "faster than light" only works with retarding mechanisms). This is all like selling dehydrated water (Just add water!).

Am I reading the wrong thing? When I click on the link, I get a story
about "We have broken speed of light".

Looks like "We go really fast, lose command of English".

To comment on the what the link has on it, There are some really
fundamental mistakes in it:

What kind of scientist measures "instantaneousnous"? How do you measure
that? What is the margin of error on apparent simultaneous occurances?

How does traveling faster than light allow you to arrive before you
leave?. That would be time reversal, not traveling faster than light.
According to their experiment, you could get there no sooner than
instant you left.

Anything is possible when you get your science news from The Telegraph.
Kinda reminds me of the old DAK catalogs.

I'd like to read their publication on the matter.

And as for tunneling, its been known about for quite some time.

I read the original work too, and came to much the same conclusion. I'd put more stock in zero point energy than this little experiment allowing us to get somewhere before we start.

The telegraph's article is a lot more satisfying though, if incorrect.

Hi Mike,

I'm accustomed to material dealing with evanescent waves. I've
alluded to them in other postings here where the wavelength and the
frequency of the energy do not follow classic conversions such as 1 =
f/t. Evanescent waves are one of but many of the energy transfer
mechanisms being turned into something useful at the nano-scale. The
original article cites work done in the audio spectrum ("Beating the
Sound Barrier"), but unless you are versed in the trade, you might
think in terms of Hz, KHz, or MHz. Instead, their region of acoustic
interest is in the THz.

Touchy-feely at the nano level is wholly different as it departs from
Newtonian rules, but doesn't quite delve into Quantum (a middle ground
of the curious where current flow is one electron at a time).

Anyway, back to antennas.

Another, related, "photonic" oddity is found in materials with
negative indices of refraction. Locally, Boeing has done some
investigation into it:
http://www.boeing.com/news/frontiers/archive/2004/august/i_tt.html

This reveals a cube of artificial dielectric with a negative index. It
is also relegated to the microwaves for testing the concepts. I
designed models in EZNEC years ago, but quickly ran out of segments
for all but the simplest prisms.

A negative index of refraction gives you a lens that can focus to an
infinitely small spot (a must have for those doing photolithography in
the nano scale). The kicker is that the lens is flat. And, of
course, it bends rays backwards to expectations (backwards as in to
the other side of the normal, incidence; not reflection).

***** sucker bait follows *******

Now, if we were to split the cube diagonally and repeat the evanescent mode, then maybe we could light up dark matter.

Why do you insist to continue to post to groups that have nothing to do with
your twisted minds or really care about continued trashing of each other.
For someone claiming to have a IQ<--248 your claim of not knowing how to use
a spellchecker is amazing as you try very hard to misspell words!!

Read the ARRL's story on Motorola LV: 'Less than two years after
announcing its Powerline LV Access BPL product, Motorola has decided to
suspend product development and to devote its resources to more promising
markets, industry sources say.' Full story at
http://www.arrl.org/news/stories/2007/04/25/102/?nc=1 .

That is a reduction in focus on Access BPL, and the form with the widest
impact, but that is only one form of the BPL scourge.

Dave, perhaps what you see in me as pessimism is more realism, and it is
born out of working in the telecommunications industry, understanding the
carriage market and the challenges in competetive broadband delivery.

I have also measured BPL emission on the street, analysed measurements by
others and written / reviewed many reports on the impact of BPL
emissions. I have a good understanding of the impact, and the BS of the
'it won't affect me' justication of apathy.

The transformation of ham radio to the province of six hour hams with
their shack on their belt impacts the sustainability of ham radio. They
do not have the knowledge and experience, the credibility to challenge
the threat.

The 'it won't affect me' approach and redneck solutions help to divert
attention from the BPL problem.

BPL might crash and burn of its own accord, and I frequently see people
calling out the failure of a small BPL deployment as evidence, but in the
last few hours I have reviewed a report on ambient noise measurements in
an area for planned BPL deployment in the coming weeks, and the
implementor is no small naive power company business development unit.
BPL remains a serious threat.

Owen

Cecil:

These guys are truly amazing. It is obivious they are nit-picking in an endeavor to make you appear as an idiot; equally obvious is that, they fail every time! However, they do succeed in making complete bozos out of themselves; and, to all appearances, they show no awareness of what they have/are done/doing, how can this be possible? I mean, I know there are a lot of idiots in the world; and I know the extent of "idiot-ism" in much of the masses deserves watching and respect; but, these guys dwarf 'em (your run of the mill idiot, that is!)

Whatever mental disorder these guys have, I am afraid it may be caused by rf--I am thinking of swearing off amateur radio and going wholly with the net--before it is too late!

Don't try to analyze Mork's behavior. He has no explaination or
viable reasons for his actions, except what he makes up in that empty
void between his ears. Apparently, Mork thinks it is perfectly ok to
disrupt the NGs with his flooding and violate everybody else's right
to use the group as intended.

Warning: Mark C. Morgan, kb9rqz, is a general nuisance and NG flooder.
Please make it a point not to work this creep on the air. He is a poor
example of a ham and is not worthy of a contact with any real hams.

LOL! At least Harlequin doesn't reprint shakespeare!

As happens quite often, I view my "crystal ball" and I must agree to
disagree.

To me, it is quite clear, we have only kludged together "theories" and
equations which we slave with (but, are quite usable till better comes
along), we use these under the burden of great errors and unsolved
riddles ... to others, it may indeed appear as a finished work of art ...

I think you'll be surprised at how much flexing tht antenna can take.
I've seen the one on the big tower bent over with the top appearing to
be 4 or 5 feet off from vertical. That's a long ways for a 21 foot
tall vertical.

>before the tower does even with no additional guying.

I have two of the big Diamonds up. One is at roughly 30 feet on the
side of the big tower and the other is on top of 20' of 1 1/2" TV
masting on the3 North side of my shop. A third is going up on the big
tower for digtital at roughly 60 feet and the lower one is going to be
moved directly under it.

Hi Henry

I have some. I'll send you one of the type designed to fold if that
meets your needs. It'll mate with a reverse polarity SMA like on most
Wireless devices.

Jerry

I agree and like your flatland anaolgy. I think if we are not careful we can be as narrow-minded about the nature of the universe as those who thought the only elements were earth wind water and fire or Earth was the center of the universe. We are not that much closer to the truth than they were.

Hi Jimmie,

Their contemporaries thought that trees could enter into their dreams
and explain the mysteries of life - hence the legacy of "knock on
wood" which a lot of this ersatz hero worship correspondence is so
like.

Let's see, a link to a National Enquirer story headlines a story about
a surgeon who grafts a pig's head onto Paris Hilton, and the poster
suddenly crows like a medical authority:
"Amazing how Lister and Pasteur were just so many
country bumpkin scientists!
If Professor Christiaan Barnard was such a whiz
with heart transplants, he would have done this years ago."

I have a yagi made for a radio modem by a reputable manufacturer. Design frequency is near 900Mhz 13db(i/d/?) gain and it iis about 6 ft long, maybe longer. Connection is via a very short piece if 1/4 inch coax which also includes a ferrite bead BALUN. Reccomended connection is via low loss coax.I think it was last used with LMR900, about 100ft. The antena was removed from service due to poor perforamce and replace wiht a parabloic antenna, I belive the gain of this antenna was about 19 db again of uncertain reference. I hope this gives an idea of what a proper idea for the application should be..

Sounds like you are already attracted. The question is, are you ready
to go under the same surgeon's knife to enhance your appeal to her?

Now, there's a test of theory and acclaim being bundled under the
mantle of "news releases!" Volunteer for elective surgery and
elevate this story above the fold in USA Today.

As for antennas, I see none of the dewy-eyed crowd of worshipers
daring to tread the turf of building/modeling/discussing the necessary
glass prism to commemorate this momentous announcement of FTL DXing.
Can we even hope their zeal in this well-spring of faith extends to
pushing a credit card across the display case to buy a magazine about
one?

Isn't half the fun of HF using ones brain as an organic processor to pull words out of noisy signals? <grin>

Seriously I always wondered why something like PSKnn became so popular when with a bit more code writing on your average PC might have yielded a viable digital voice circuit. Maybe your average ham doesn't want to say much, only caring to exchange RST's for a card! This is actually what deters me from PSK31, most seem to only want a limited contact..

Does anyone know of a sound card/PC system that does digital voice over SSB bandwidths? I note the comment about group delay and other problems using amatuer transceiver equipment. Could not your rigs characteristics be mapped by a "known" station to reduce this problem.

Since we are on the topic, has anyone used PSK31 mobile/moving? Are there phase shift issues to be allowed for due to the physical movement of the station. Probably more of an issue on VHF than HF.. Looking to do some slow PSK/GPS stuff from the car..

Cheers Bob VK2YQA

Could we get that in English please.

Warning: Mark C. Morgan, kb9rqz, is a general nuisance and amateur NG
flooder. All amateurs should make it a point not to work this creep on
the air.
He is a poor example of a ham and is not worthy of a contact with any
real hams.

I disagree. I have run into a large number of PSKrs who have no trouble
ragchewing. Often with an extensive set of preset keyboard macros.... :/

I had a several-minutes QSO on PSK31 and the OM actually thanked me for
not being a "Drive-by QSO." So, the people who are just filling lines in
a logbook aren't the exclusive users.

Just my two cents.

Oh, I'm not downplaying it as a threat. It's just one more symptom,
though of what has gone wrong in our world. It used to be that "money
talk's; bullshit walks" was the adage. Now it's "money bullshits and
everyone else is supposed to bow down and kiss its feet."

Actually, from a purely engineering efficiency point of view, getting it up there around 2-6 ghz would be the cost effective solution. You need less power and what power you do put on the wire tends to stay quite close to it for long distances....plus there's tons more spectrum available.

So how is it gonna eat up having its receiver saturated? I'm pretty familiar with digital comms and, with the exception of some pretty slow speed stuff designed for weak signal work, most of it is not very good unless you have a really solid signal-to-noise ratio. I'm just saying that if it's getting out to my antenna that loud, then my kilowatt is gonna have a fair chance at saturating the thing's receiver. And the more noise they make, the more I'm apt to have to use the kilowatt to shout over them.

Of course in our current enforcement situation here, I'd probably simply be told to stand down and have to go to great legal lengths to appeal the ruling.

Digital is not analog, when adverse conditions have made an analog
signal totally unusable, a digital signal, most likely, may still be
achieving 100% error free data transfer--it is just the nature of the beast.

The "intelligence" of the software controlling the data transmission(s)
is the single most important factor--as logic would dictate. Even under
almost total saturation (it would be virtually impossible for 100%
saturation, baring hooking the kw+ rig directly to the power lines) of
the BPL signal some type of heterodyne would be occurring with the KW
signal. Since digital is simply detecting an ON/OFF signal, in
conjunction with spacing/length of these, an on/off signal is still
detectable in this heterodyne--given the software is aware and capable
of reading this signal and switching "modes" to do so, no harm is done
to the data ... and without doubt, new error correction methods will
also develop as BPL grows and hf-rf-terrorist-hams challenge this system
... <LOL!>

Digital is magnitudes more robust than analog, again owing to the very nature of the beast and the simplicity of the on/off, pulse width, timing nature of the signal.

JS

642. "Buddistick" and MFJ-1622

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-19 07:33:07 UTC
From: Brian Reay <see@website.invalid>
Message-ID: <TmSxi.25092$6z6.22993@newsfe1-gui.ntli.net>
Source record: 37156

I'm in the process of trying to help a local with an antenna problem. He lives in a ground floor appartment and can't get a fixed outside antenna.

I'm thinking of something on the lines of the Buddistick and MFJ-1622, although ideally a home made version and a hidden counterpoise run down to the ground and tucked away. A small bracket would be fitted to the window frame (or near to it) and the antenna would be removed when not in use. He only runs QRP type power so EMI is probably not an issue.

Comments, other ideas, please?

643. How much can the impedance of coax vary from its characteristic impedance?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-19 16:28:32 UTC
From: mcclements@gmail.com
Message-ID: <1187540912.064738.6170@g4g2000hsf.googlegroups.com>
Source record: 37157

Hello,

I bought some no name RG-59/U coax (RG-59/U-SP-95 Made in the USA). I went to cut and tune a 1/4WL matching section for 3.8Mhz. I cut the coax a little longer because I intended to tune it with my MFJ259B or.LP100 exactly to the design frequency. I have a 50 Ohm dummyload that actually is about 54 Ohms @ 3.8Mhz. Plugging the numbers into ON4UN's program for calculating impedance along a coax line: Given the coax is 75 Ohms and the load is 54 Ohms, the program reported that if the line was a 1/4WL long the impedance at the source end would be about 105+j0 Ohms.

However my actual measurement with both the MFJ259B and LP100 showed an impedance of 74 + j0 Ohms.

http://remote.wu2x.com:8888/lee/quarter-wave-xfrmer-75-meters.jpg

I plugged in a few numbers into ON4UN program and calculated it would take coax that had a characteristic impedance of 64 Ohms to see the transformation that I am seeing.

Is there any error in my logic here? If this coax really is 64 Ohms, then I'd like to find something that really is closer to 75 Ohms so I can achieve the 2:1 ratio that I intended.I still have another 100 feet of it and can do more tests with the tools I have on hand.

73,
Scott, WU2X

: Given other ways in which I have seen people exploit some of The Internet's
: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says
and on their posting patterns. I don't think "The Internet" (capitals, no
less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't
mind having it explained again to you, do you now?). The reason my
"symptoms" are such a perfect fit to the textbook is because the people
causing the campaign "fitted me up" in such a way that what they did
would resemble the symptoms of schizophrenia. Hence TV, radio, other
media, people in the streets etc. By a fortunate coincidence (for them)
these mthods of harassment are the ones which offer easiest channels of
access (for them).

It's really quite neat. All it takes is for people to start believing
that the "symptoms" aren't symptoms but reality, though, and the house of
cards collapses in a heap. And there are _lots_ of people now who knoiw
full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd
have to lock up a lot of people if sending annoying email was a crime"

"Er....."

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and
phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in
Oxford, we went for a drink with the technical director, and a couple
of other employees. The TD said in an "as-if" aside to one of the others,
"Is this the bloke who's been on TV?" (he said it directly in front of
me, and obviously meant mke to hear him saying it). The other person
replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with
him? He's so insignificant, why would they possibly want to spend the
resources going after him and putting all that expensive technology in
his home, when there must be much better targets?". The Technical
Director was given to sometimes disrespecting people, you see, and in my
case he couldn't see the point of anyone expending money on harassing me.

: The point is that there are two possibilities happening here-

: 1. There's a large conspiracy of people out to get you, for no
: other reason than that they have the means to do so, and that
: it involves a lot of the Media & a proportion of the public

: 2. You (who admit to having some headspace problems) are suffering
: from acute paranoid schizophrenia.

: Possibility #1 is _possible_, but would be unprecendented (OTOH,
: how would we know?), unfeasible, and many other things beginning
: with _un_ which I can't think of at the moment. Besides, if there
: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we
have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin
: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what
actually happened a few days previously, that it's completely reasonable
to assume that someone told Levin about the meeting, hammed it up a
little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that
consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but
really we're afraid of him, or is it perhaps our own propaganda that
we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very
exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I
explained this nor my GP believe me either (until the friend found out
otherwise!). If someone just presented this to you as I am presenting it
now then I wouldn't find it credible (most likely), so it's not until you
actually find out it's true that you can find it credible. And by then
it's too late, because they've got you in their trap and explained how
"funny" the abuse is.

Hi Scott,

Unless both ends are completely shielded (which is to ask: Is the load
a shielded load?), then you need to choke things.

A quick test would be to take the load end of the line and coil it 8 -
12 turns around a 6 inch cylinder. Does this change your impedance
reading? You will need this choke for your antenna anyway, so plan on
something like it.

: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says
and on their posting patterns. I don't think "The Internet" (capitals, no
less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't
mind having it explained again to you, do you now?). The reason my
"symptoms" are such a perfect fit to the textbook is because the people
causing the campaign "fitted me up" in such a way that what they did
would resemble the symptoms of schizophrenia. Hence TV, radio, other
media, people in the streets etc. By a fortunate coincidence (for them)
these mthods of harassment are the ones which offer easiest channels of
access (for them).

It's really quite neat. All it takes is for people to start believing
that the "symptoms" aren't symptoms but reality, though, and the house of
cards collapses in a heap. And there are _lots_ of people now who knoiw
full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd
have to lock up a lot of people if sending annoying email was a crime"

"Er....."

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and
phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in
Oxford, we went for a drink with the technical director, and a couple
of other employees. The TD said in an "as-if" aside to one of the others,
"Is this the bloke who's been on TV?" (he said it directly in front of
me, and obviously meant mke to hear him saying it). The other person
replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with
him? He's so insignificant, why would they possibly want to spend the
resources going after him and putting all that expensive technology in
his home, when there must be much better targets?". The Technical
Director was given to sometimes disrespecting people, you see, and in my
case he couldn't see the point of anyone expending money on harassing me.

: 1. There's a large conspiracy of people out to get you, for no
: other reason than that they have the means to do so, and that
: it involves a lot of the Media & a proportion of the public

: 2. You (who admit to having some headspace problems) are suffering
: from acute paranoid schizophrenia.

: Possibility #1 is _possible_, but would be unprecendented (OTOH,
: how would we know?), unfeasible, and many other things beginning
: with _un_ which I can't think of at the moment. Besides, if there
: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we
have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

Actually, I've found that, except for very slow data rate stuff, digital
signals require a BETTER signal-to-noise than analog to be readable. And
there is no partial readability with most of the commercially-used
digital modes. That is to say you either have error-free transmission or
none whatever.

> hf-rf-terrorist-hams challenge this system ... <LOL!>

You cannot recover data with a modem whose input transistor is biased off
by rectified RF. I know this. I've tried it.

> Digital is magnitudes more robust than analog, again owing to the very
> nature of the beast and the simplicity of the on/off, pulse width,
> timing nature of the signal.

The only real advantage digital has is its error-correction algorithms.
Those can do very good work when they actually have enough data to work
with. But once the data recovery by the the very ANALOG device that is
receiving the signals drops below their threshold, then the recovery
becomes terrible. Some modems are better than others. My old Telebit
19.2K could suck 1200 baud recovery out of a phone line you couldn't talk
on. But give it a couple of volts of RF in the mix and it would drop
stone cold dead. And BPL has the "disadvantage" of not being able to
filter our frequencies AND use them at the same time. At worst, I'd
drive the BPL machinery to other parts of the band from where I was
working....

Lots of times. My CW error-correcting hardware is excellent, is always on,
and conveniently located in my head.

But you're missing my point. A modem is always an analog device. And if
it's listening on a frequency with a loud signal on it, then it can be
saturated by that signal. I've not seen many that could copy the
heterodyne. Mostly they just stop giving any recovery at all.

Richard,

You asked if the load is shielded. I was using a MFJ dummy load and the resistor is inside a metal enclosure. Not sure if this mets your shielding criteria.

I did have twelve #31 ferrite beads (1.125"X.0.5") on both the input and output end of the cable, so I can say for sure that aspect was taken care of. I didn't notice any changing values whenever I would move the coax around or grab onto either.

At worst some neighbor would get pissed off that you are messing up
their Internet and start a FUD campaign to force you off the air for
"dangerous radiation".

It happened here with the cell phone companies and as a side effect
anyone with more than 20 watts output needs to get their station
certified as safe. I know there was a chance of hams getting a
blanket exemption, but I don't know if it was approved or not.

Geoff.

mcclements@gmail.com wrote in news:1187540912.064738.6170
@g4g2000hsf.googlegroups.com:

Scott,

The inconsistency you describe seems to lie in one or more of your instrument, the coax, or your test setup.

I am not sure whether you are solving a coax problem, or validating the LP100.

The impedance plot certainly clears away questions about whether you have properly accounted for velocity factor. The phase plot has a strangely flattened minimum.

I wonder about your confidence in the 54 ohm load, and your answers to Richard about choking the cable suggests something non-ideal.

You could try a test with s/c or o/c stub (or both), so eliminating the 54 ohm load. Of course, in such a test, the line loss becomes more important. It also tests your instrument at extreme mismatch, so you might want to validate it on o/c, s/c, and some reactive 100:1 loads using known coax sections.

Back to the loss thing, the line loss calculator at http://www.vk1od.net/tl/tllc.php uses a more sophisticated line model than any other calculators I have seen, and contains data for a hundred or so of the most common commercial lines. It also calculates the expected impedance transformation for the line.

For example, it suggests that a 6m length of Belden B9204 (RG59/U type) o/c line at 3.8MHz has an input Z of 0.84-j84.91.

BTW, have you stripped a bit of cable down to see visually if appears physically sound. Common problems I have encountered have included unevenly woven braid, unevenly laid strands in centre conductor (though yours should be solid), un-centred centre conductor, air inclusions in the dielectric.

As I said, I am not sure that the LP100 has been validated and the focus is entirely on the particular coax.

Interesting that you mention that.

Some of our good friends in Tasmania started a FUD campaign to scare ordinary electricity consumers about the electromagnetic raidation hazard of electric blankets when they were BPL 'enhanced'.

I think that the last thing that we hams, who radiate much higher field levels than BPL, would want to do is excite paranoia over EMR hazards.

Didn't we learn anything from the campaign against the visual amenity of mobile phone infrastructure, they played the EMR FUD like it was an art form.

If we were ever required to prove the compliance of our stations with EMR standards using surveys from accredited test houses, we would be off the air economically, and ham radio would no longer be an experimental activity.

There is some steady, sound engineering / scientific work going on to discover and reveal the impact of BPL, it is small in scale but IMHO credible and ongoing. Uninformed and redneck comment from the amateur community makes the job just that much harder.

663. Difference between models of MFJ-931

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-19 23:45:07 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.19.23.45.04.82020@from.qrz.com>
Source record: 37177

Anybody know what the differences are between these two models of MFJ-931
artificial ground?

http://cgi.ebay.com/MFJ-931-Artificial-RF-Ground-New_W0QQitemZ290151133276QQihZ019QQcategoryZ4671QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

http://cgi.ebay.com/NEW-MFJ-MFJ-931-Artificial-RF-Ground-w-Manual-NR_W0QQitemZ330157223601QQihZ014QQcategoryZ4671QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

They are both called "MFJ-931" but as you can see they have different
control layouts.

The former is the one that's currently listed on the MFJ website.

I'm just wondering if they are equivalent electrically and MFJ just
decided to move the controls around a bit.

>move the coax around or grab onto either.

Hi Scott,

That seems adequate to the task of differentiating any problem of
common mode intruding into the measurement.

Another easy test would be to simply frequency sweep the terminated
line until you found the 100 Ohms you expect. This may take you well
out of the Ham bands. When you do find 100 Ohms (without reactance)
you can then ratiometrically adjust the length to the required
frequency (which would suggest your problem was probably misjudging
the velocity factor of the cable).

> I am not sure whether you are solving a coax problem, or validating the
> LP100.

Well, the LP100 and MFJ259B readings are virtually identical. That
gives me some confidence in both instruments. The goal was to tune a
matching section for my loop. Which BTW,
I did and it is working fine. However, the SWR is only reaching a
minimum of 1.6:1 because I didn't get the full 2:1 step down ratio.
Now, I am not going to lose sleep over that, but it seemed like a good
opportunity to understand what happens outside the textbook.

> The impedance plot certainly clears away questions about whether you have
> properly accounted for velocity factor. The phase plot has a strangely
> flattened minimum.

Yeah, I was surprised by that too - but I was pleased to see that - if
it is true. I know the loop won't be bandwidth limited by my matching
section.

> I wonder about your confidence in the 54 ohm load, and your answers to
> Richard about choking the cable suggests something non-ideal.

Confidence in that it really is 54 Ohms? Well, I wouldn't bet my life
on it, but all my instruments seem to agree that its 54 Ohms. I
choked the cable because it was driving me crazy. No seriously, I was
building the matching section to use on my loop, so you have to slide
those ferrite beads on before you solder on the PL259s. I didn't put
them on because I thought they were necessary when I measured
the matching section, they just happened to be there at the time.

> You could try a test with s/c or o/c stub (or both), so eliminating the

> might want to validate it on o/c, s/c, and some reactive 100:1 loads
> using known coax sections.

I measured it with an open end with the MFJ and it had zero reactance
right in the range the LP100 showed it not have any reactance.

I have had good luck with Belden, so maybe I'll order some of that in
75 Ohms and see if its any different.

I just ordered a digital squawk box made by AOR. I'm interested in staying in contact with my wife's mobile when she is "on the road" hawking the business' wares at quilt fests and the like. Granted, we use the cellphone most of the time, but there are places in the USA that still are not covered by such devices, or the system is so overloaded that you are lucky to get through. (this is my excuse for spending the money)

I like all kinds of contacts, short, long, etc. I'm not fixated on any one type of qso.

I want to enjoy the digital technology while it is still new, at least it is new to me. I felt the same way about RTTY, Amtor, Pactor, Pactor II and PSK 31 (I haven't used the latter yet).

Hopefully, the alleged improvement in voice communications at low power will be just what I was looking for. I said hopefully. <G>

Which bands are the most important to him?

If it is HF and if he is into CW or the digital modes, the old box-fan looking magnetic mode antennas worked fairly well, considering. Nothing would have to be outside for that to work well.

I operated for quite a few years from a ground floor apartment. CW and the digital modes were by far the easiest on which to make numerous contacts. Of course, this is obvious to anyone with a little bit of experience, but, just in case, I thought I would mention it.

If your friend just has to talk on 75 phone, he would be better off building a gorilla-strong mobile station in his car, assuming he has one. No one can give you any serious crap about operating from the vehicle. If they do, due to RFI, tell them that antennas make less interference when elevated, so that the answer would be to give your friend permission to run a random wire along the peak of the roof and to then feed it with twin lead. Then help the other folks in the building install filters (gratis - of course) and to have them call him if they have problems. That's what I did and the manager eventually let me put a centerfed dipole fed with twinlead on top of the roof. It worked great and only cost me a few dollars for clamp-on ferrite toroids (Radio Shack). Of course, I was running 100 watts or less during the evenings when folks were watching TV on the apartment owned CATV system.

There are answers, you just have to be creative. Operating digital modes or CW really does make this a much easier feat to accomplish.

668. Re: How much can the impedance of coax vary from its characteristic impedance?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 04:22:26 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <13ci5o4t4gsvj7f@corp.supernews.com>
Source record: 37082

Most of the important points have been well covered, but let me add a general observation:

Loss will skew any measurement toward the characteristic impedance of the cable. This is intuitively evident, since if the cable is lossy enough, you'll see its characteristic impedance at the input regardless of what's connected to the other end.

So when you say you're seeing 74 ohms when you should be seeing 105, I'd bet without further evidence that the cable has more loss than your model thinks it has.

>
> 73,
> Scott, WU2X

My rule-of-thumb is that I shouldn't be surprised if the actual
impedance of coax is anywhere within ten percent of the nominal
value. A while back I went looking for precision 50 ohm coax to be
used in a test system that among other things does a calibration of
test instruments, and the impedance of the coax really does matter.
Even cables that cost several hundred dollars for a one or two meter
length (that's admittedly with connectors attached...) didn't
guarantee impedance closer than a couple ohms out of 50.

Add to that that I just went looking for typical loss specs for RG-59-
type cable on the web and the first one I looked at lists it as 70 ohm
line, not 75. Although the expected impedance you calculated is for
75 ohm line with no loss, adding a dB loss doesn't change things all

that much, certainly not enough by itself to account for your reading.

Seems like with your impedance analyzer, you could pretty easily find the impedance and the loss of your line, and use those in your formulas to see if the performance is what you expect. Have you measured the line with the far end shorted and with it open? Assuming accurate measurements, the line impedance will be the square root of the product of those two measured values.

Then there's also the possibility that your impedance measuring device isn't all that accurate at some impedances....

Cheers,
Tom

Roy - Your comment made me double check my work. I was using ON4UN's
software and I was entering the estimated loss at my design frequency.
Then I realized when I cranked up the loss (to see the effect clearly)
that it wasn't doing anything with impedance along the line. And then
I visited Owen's link for the second time and plugged in the details
from my cable. I must have done something wrong the first time -
because let me tell you it was dead nuts what I saw (Zo 75.01-j1.45
). Case closed!

: Given other ways in which I have seen people exploit some of The Internet's
: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says
and on their posting patterns. I don't think "The Internet" (capitals, no
less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't
mind having it explained again to you, do you now?). The reason my
"symptoms" are such a perfect fit to the textbook is because the people
causing the campaign "fitted me up" in such a way that what they did
would resemble the symptoms of schizophrenia. Hence TV, radio, other
media, people in the streets etc. By a fortunate coincidence (for them)
these mthods of harassment are the ones which offer easiest channels of
access (for them).

It's really quite neat. All it takes is for people to start believing
that the "symptoms" aren't symptoms but reality, though, and the house of
cards collapses in a heap. And there are _lots_ of people now who knoiw
full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd
have to lock up a lot of people if sending annoying email was a crime"

"Er....."

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and
phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in
Oxford, we went for a drink with the technical director, and a couple
of other employees. The TD said in an "as-if" aside to one of the others,
"Is this the bloke who's been on TV?" (he said it directly in front of
me, and obviously meant mke to hear him saying it). The other person
replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with
him? He's so insignificant, why would they possibly want to spend the
resources going after him and putting all that expensive technology in
his home, when there must be much better targets?". The Technical
Director was given to sometimes disrespecting people, you see, and in my
case he couldn't see the point of anyone expending money on harassing me.

: The point is that there are two possibilities happening here-

: 1. There's a large conspiracy of people out to get you, for no
: other reason than that they have the means to do so, and that
: it involves a lot of the Media & a proportion of the public

: 2. You (who admit to having some headspace problems) are suffering
: from acute paranoid schizophrenia.

: Possibility #1 is _possible_, but would be unprecendented (OTOH,
: how would we know?), unfeasible, and many other things beginning
: with _un_ which I can't think of at the moment. Besides, if there
: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we
have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

Peter Ceresole (peter@cara.demon.co.uk) wrote:
: In article <Ds0L1o.BMF.0.bloor@torfree.net>,
: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin
: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what
actually happened a few days previously, that it's completely reasonable
to assume that someone told Levin about the meeting, hammed it up a
little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that
consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but
really we're afraid of him, or is it perhaps our own propaganda that
we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very
exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I
explained this nor my GP believe me either (until the friend found out
otherwise!). If someone just presented this to you as I am presenting it
now then I wouldn't find it credible (most likely), so it's not until you
actually find out it's true that you can find it credible. And by then
it's too late, because they've got you in their trap and explained how
"funny" the abuse is.

Sorry I don't have the time to dig into this more deeply right now. I'm sure Owen has done a great job in estimating loss, but here are some things to think about:

1. Belden 9204, like a lot of other 75 ohm cables, has a copper-plated steel center conductor for strength. At 3.8 MHz, depending on the copper thickness, current might be entering the steel. If it is, the loss will be a lot more than a simple model for solid copper would predict. I notice that the statement at the bottom of the data you posted says "Loss model source data frequency range 10.000 - 1000.000 MHz". You're well below that. A good reason for a lower limit on the model would be not accounting for current penetrating into the steel.

2. Some common RG-59 type cables have stranded center conductors and tin plating. Both increase the loss. More importantly, stranding results in much thinner copper for a given percentage of wire diameter of copper cladding.

3. A logical way for a cable manufacturer to cut costs is to put a thinner copper cladding on the center conductor. This would have no effect on the performance at VHF and above, where the cable is most likely to be used. So thin copper wouldn't surprise me.

The only way to really know the loss is to measure it. And this might not be the reason for any apparent error. But it might be. As Tom said, though, 10, or even 15% deviation from nominal isn't unusual.

Let me relate a story. Years ago, I came across a very large surplus quantity of approximately 0.1" diameter 75 ohm cable. It was just before Field Day, and because it looked to be in good physical condition, I measured off 100 feet, put a couple of BNC connectors on it, and tossed it into the pack as feedline for the 40 meter antenna. (I backpack my gear on Field Day, so weight is a major consideration.) Field Day went ok, but it was one of those years when we were just at the other stations' noise level, requiring a lot of repeats, QRZs, etc. Afterward, my FD partner was saying that all we needed was another 2 or 3 dB gain on 40, and we'd do a lot better. I agreed. Not too long afterward, I was measuring the impedance of a folded dipole through a half or full wave of that 75 ohm coax (since I had a lot of it), and was getting bizarre results. And that's when I first learned of the importance of cable loss on impedance transformation. I had been assuming lossless cable for my calculations of load Z given input Z, but got suspicious that loss might play a role. When I modified by equations to account for loss, I was surprised at how much difference even a little loss made. (As it turns

out, loss makes more difference when the load Z is far from the cable Z0, as it was in this case, than when they're about the same.) I put more and more loss into the formula until I got about what I expected for load Z, given the input Z I was measuring. 4 dB at 7 MHz! A quick measurement with the wattmeter confirmed that the cable did indeed have that much loss. The problem was the thinness of the copper cladding on the very small steel center conductor strands. Even though the cladding was a substantial portion of the wire diameter, it was still very thin because of the tiny wire diameter. At our next sked, I told my FD partner that I'd figured out a way to get a couple more dB out of our 40 meter antenna. . .

Given that Mr Corley clearly holds a certain fascination for some people,
and that his website, although "informative", isn't exactly ideal for
encouraging discussion of the sort that we all enjoy so much (including
Mike himself, by the look of things), would anyone be up for a Mike
Corley newsgroup - uk.fan.mike-corley, alt.fan.mike-corley, whatever?
(Sorry, I'm not very well up on these things.)

This would be a perfect place for Mike to post his writings, and perhaps
the occasional "look at the ...mike-corley newsgroup" posting in uk.misc
and so on would be accepted in place of the current cross-posts.

Roy, the reason I show the freq range on which the model is built is for exactly the case you are discussing. It makes it clearer when the model is an extrapolation, and confidence limits should be wider.

One of the things that I have done when doing the regressions on the source data is to discard low frequency points that have high error wrt the regression. This effect occurs almost intirely with CCS centre conductor type cables.

Not all RG59 and RG6 type cables have CCS, and the worry with low cost CCS is whether the coating is even thinner than the 9204.

I use RG6 quite a bit for ham work, and the cable I buy uses a HDC centre conductor. I would avoid CCS for lower HF.

Back to the original problem, it would take a huge loss to deliver an input impedance of just under 75 ohms from a 54 ohm load and a quarter wave of nominal 75 ohm line. The Zo looks low.

Owen

PS: The quoted output from TLLC is somewhat hard to read due to the Greek characters and some other symbols not copying to plain text.

Interesting topic! I've never encountered an RG59 that had a stranded
center conductor but I'll take your word for it. I *have* seen an 80 ohm
RG59, though (Belden 8221).

Come on "Big Ears", why don't you admit that you made this posting? This is exactly the same line you were feeding me a few months ago. The posts are from the same news server, it's even the same newsreading software (Forte Agent .99e/16.227).

I'm afraid that if you friend "in the know" denied the existence of a plot then he was being, as they say, economical with the truth. Judging by the extreme reaction in London in May, and the panic you're showing now, as well as the replay post yesterday, I would say that things are hotting up again. But for you this time, not for me. I am out of harm's way, and there is very little you can do as long as I stay out of the UK.

Funny you should mention that Ed.

One of my long term projects is a "where is the family car" system that I had hoped to use a very narrow band/slow data link for GPS data as well as short text message exchange. Thinking along the lines of super slow QRSS/PSK31 setup on 13.56MHz. The narrow bandwidth and low power would I hope cover much of the country but I'll admit I haven't done the maths on it.

I have seen a PSK63 system that does HF mail type exchanges. Kind of slow but very do-able. Just a HF rig and laptop/PC at both locations and you can stay in touch! When the sigs are real good of course you can use plain old SSB!

Cheers Bob W5/VK2YQA

It's such a pity that the Security Service has no powers of arrest. How are they supposed to implement a proper secret police state without the ability to snatch Joe Citizen off the street whenever they feel like it?

I see. So they're not wasting six years of manpower to persecute you. They're wasting six years of manpower to prove I'm _not_ being persecuted.

I wish I was clever enough to think of something like that. I really, really do.

>When I'm told by someone who really does know such things that there was
>never any plot to get Mike then I trust that person sufficiently enough to
>accept his word.

Come on "Big Ears", why don't you admit that you made this posting? This is exactly the same line you were feeding me a few months ago. The posts are from the same news server, it's even the same newsreading software (Forte Agent .99e/16.227).

I'm afraid that if you friend "in the know" denied the existence of a plot then he was being, as they say, economical with the truth. Judging by the extreme reaction in London in May, and the panic you're showing now, as well as the replay post yesterday, I would say that things are hotting up again. But for you this time, not for me. I am out of harm's way, and there is very little you can do as long as I stay out of the UK.

> beast.

Hi John,

The error here is that that digital signal in a bpl setting is trying to function in an analog world. And for all practical purposes, while it is on the line and till it hits the modem, it is just another RF signal. Disregard the 1 and 0 aspect, and think about the rapid stream of pulses. Each one on it's own is just a "state of 1 or 0, but taken together, they are pulses that occur at RF frequencies in toto.

So here you have a string of pulses that are running at say 10 MHz. If no other signal gets into that line, all is well. But that same line, which can inadvertently radiate outward, can pick up another signal on the same frequency - and it is very likely that whatever frequency you might be transmitting on will affect it, since the pulsed frequency equivalent (sorry for the goofy term, I'm not sure what else to call it) varies by quite a bit, thereby making it vulnerable to lots of different frequencies being transmitted.

Then if say the local school bus company is transmitting on some frequency near the BPL line, that power line might pick up some of that transmission, and send it down the line into someone's modem. That modem won't be able to make any sense of the messed up packets it is receiving. It'll call for a resend, and receive more gibberish.

> The "intelligence" of the software controlling the data transmission(s)

> signal.

A packet is a surprisingly delicate thing. It takes nowhere near hypothetical 100 percent saturation with an RF signal to change one bit, which can disrupt a packet.

> Digital is magnitudes more robust than analog, again owing to the very
> nature of the beast and the simplicity of the on/off, pulse width,
> timing nature of the signal.

John I might respectfully suggest that you do a little studying on the nature of digital signals. I've been dealing with them since the late 70's, and they aren't anywhere near as robust as you believe.

Can't disagree with that sentiment.

Wasn't it documented that MI5 sometimes "bought" journalists and broadcasters?
I remember reading a report by some jouralist who had been offered an extra
tax-free income by MI5 to become their covert mouthpiece, and had refused.

Bet you lots of others didn't refuse. Why do you think MI5 have such easy
access to the BBC and media? Because they're directly paying them off, that's why.

It has been reported several times. The most recent was in Private Eye,
a few months back. As I recall they also wanted information from him;
journalists would be a natural choice for members of the Security Service
and the Secret Intelligence Service for information sources.

> It might be interesting to see what he had to say regarding their

He was most concerned that many others would have accepted such an
offer. However, we can probably make an educated guess as to some of
those who accepted: Nigel West (Rupert Allason, MP) and Chapman Pincher
would come near to the top of the list.

Good grief. The answer is to power them with DC, and tell 'em that it will serve as a magnet, thereby allowing magnetism's great healing properties. Could sell little boxes with diodes in them. Maybe a crystal or two for harmonic hegemony and celestial peace too.... ;^)

> There is some steady, sound engineering / scientific work going on to

I find much of the commentary very uninformed. Much of this has to do with the Digital folks not understanding the RF folks, and vice versa. Especially alarming is the digital folks not understanding that a high speed digital signal is for all intents and purposes an RF signal. It isn't 1's and 0's any more, it is an RF signal until it gets into the computer.

Of course, the RF savants have a hard time understanding things like "Whaatya mean Vista dropped my IP address, and the only cure is to reboot. It's been working for three days now - it just couldn't suddenly quit. Electronics doesn't work like that!"

At that point, I offer them the choice of being right, or getting things working.

Sure enough, Cecil. I do think that continual suspension of disbelief is in the same boat however.

It is a slippery slope some practice between healthy skepticism, and trying to force rational people to keep their mouths shut about any new theory no matter how crackpot it is.

When taken to its extreme, the practitioner ends up believing every alternative theory, and is skeptical toward all established ones.

Wow, my experience has been different. Aside from the obvious short DX
contact, I've spent a lot of time with pretty verbose people on psk31.

I recall one 3+ hour contact on 80 meters. Were my fingers tired!

This is true. I frequently employ private detectives to spy on people
(there's a good reason for this and I'll tell you if you guess
correctly) and one such detective showed me the latest technology only
last week. A small rucksack. One strap of the rucksack has a tiny hole
in it that you wouldn't notice unless someone pointed to it. That's the
camera: the wires lead into the rucksack itself where there is a video
tape recorder little bigger than a Walkman. I don't know if that's what
Roger Cook uses but it certainly explains why it is that the subject can
look straight into the lens and not realise (s)he's being filmed. Now, I
say "latest technology" and I think that's the technology that the
police use as well as the retired police who become private detectives,
but no doubt the security services have far more sophisticated
equipment.

A person should be able to come up with a multiple PSK31 signal method
of sending hfemail. Maybe even PSK63. I wouldn't want to send much
faster than that for BW/SNR reasons.

: >things. Firstly, there must be evidence of subversive activity on
: >his part. Secondly, there needs to be evidence of MI5 taking
: >measures to counter this subversive activity, in proportion to the
: >magnitude of the threat posed. Upon reading Mike Corley's posts,

: Alan,

: What about the following scenario? MI5 conducts "experiments" including
: field trials of novel surveillance methods. Say there was a "research
: project" underway to see just how invasive a surveillance of an
: individual could be. Perhaps it wasn't research, perhaps it was for
: training of novice personnel. Either way, there is a sizeable risk of
: detection. In order to minimise the consequences of this, you choose
: someone who is out of the public eye, and if possible someone whose
: credibility is already damaged - by diagnosis of schizophrenia, for example.
: This will facilitate the "plausible denial" if something goes wrong.

: I think this would be closer to Mike's theory.

: Mike, if you are reading, please don't post the story again. Anyone can
: read it at [snip] if they are interested. Also, don't
: think that I actually *believe* the above. On cost alone, it is extremely
: unlikely to be true, and some elements of the story (people in the media
: being "in on it") are just too crazy (though I can see how the paranoia
: builds to the extent that you can see "them" everywhere).

My argument is that the fact that it's so totally crazy is what makes it so
plausible and so hard to prove.

I shall continue to try to find ways to kick down the house of cards. Because
it is a brittle structure. It only needs one person to corroborate, and then
it's all over.

: P.S. Anyone else ever thought of "what-ifs" along the same lines? I
: remember as a boy daydreaming that maybe I was the focus of national

: attention in a "let's follow the life of one person from life to
: death" study - that while I was out or in bed there were programmes on
: the television about my life so far, etc. It makes for a good fiction,

Perhaps MI5 have become victims of their own paranoia. Their agency has been thought of as acting disreputably, so when their decision arrives, they don't think twice about breaking the law. Whereas say CSIS (the Canadian equivalent) is at pains to point out how it would never ever do anything in contravention of the law, and how it is strictly controlled in what it does and how it does it.

If this matter does ever make it into the public gaze, then it won't just be a few individuals in the media or security service who'll get hit. The UK is supposed to be a civilized democratic country (East Germany called themselves a democracy and they had the Stasi, but anyway). In a civilized country these things shouldn't be happening - and it is ultimately Parliament and the government who are answerable for not imposing sufficient restraints and accountability on those who are supposed to be ensuring security for citizens, not jeopardising it.

I don't have florid symptoms. But I'm in a difficult situation, because those people who don't know, aren't going to believe, and those who do, they just go along with the crowd. It's never a good idea to go against the grain, and the grain here is defined by interests in the establishment and the media. Even people who could say out loud what was happening won't, because then there's a risk that they'll be seen as traitors and ostracised.

Usually this type of 'hidden abuse' is racial and targetted at a racial minority within a country. You keep the minorities out of the good jobs, but you don't admit discrimination exists. It happens everywhere, not just in Britain. The persecution that is going on now is in reality a refined form of racism. Instead of "nigger" it's "nutter", and abusing the mentally ill is still socially acceptable today. In 50 years it might not be, but today there isn't any social or legal sanction against it.

So really they've refined racial harassment down to a minority of one. The words may be different, but the methods are the same.

After looking over some of the followups to your post, I had a thought.

Addressing the errors' introduced by loss, and the possibility that
you're seeing worst case loss at a lower frequency, why don't you go
back and re-measure your matching section at 3X, 5X, 7X 3.8 mcs.?

It's the reverse of a trick I've used to cut n*1/2WL 1:1 coax runs for
VHF -- by measuring at *sub* multiple freqs.

Anyway -- it's a thought.

There are very rugged modems. Most people just accept the modem which
was included with their computer. A cheap modem implemented, almost
totally, in software; these can exhibit poor performance.

You get what you pay for, and like I say, BPL is a developing
technology; or, in other words, problems must be found before they can
be fixed. Your KW+ signal will be a great aid, possibly, in that
direction ...

Having worked in the software/algorithm/data-compression aspects of
modems, I have experienced high levels of line noise on standard modems
which needed new techniques to solve ... Although I have seen many
instances where line noise is at such levels even speech is horrible,
and data xmission slows to a crawl, there are few instances where it
becomes absolute zero--baring the physical disconnection of the line.

If you are inducing interference of a noticeable level in a persons
home/business that is noticeable, it will be more than just noticeable
on the BPL modem!

It is as if you have looked at one form of plant life and declared all plant life the same.

How you choose to implement digital, timing with pulses, pulse durations, etc., or any combination--takes digital into the world of variety. Although it can be difficult to get the machine code out of a modems hardware and study it (really impossible for the avg computer user), astute hacker/programmers do it all the time.

You are stuck in the "already all is known world" and see every new and interesting problem as halting to that technology in question. Mans history reveals such thinking to be the lie it is.

We deal in computers, we deal in a world where nothing is impossible--some things just ain't been done yet ...

Well, the "legal option" has just foundered on the rock of lawyers refusing to deal with me on the grounds that my perception of harassment must be due to the disease.

So we're back to square one again, the same place we were two years ago.

Now perhaps one of our uk.legal participants can clarify this point. To me it seems illogical that lawyers should have the final say on whether you are allowed to proceed with a civil case or not. Is there a default mechanism or agency for cases such as mine where it is difficult to find a solicitor to represent you? What exactly is the "official Solicitor"? What is it possible to do if you can't find a lawyer to represent you?

A chance to get a useful response out of the uk newsgroups! perhaps they can be good for something else besides spamming.
.....

Represent yourself....like the defendants in the McLibel trial.
you will need to read some law..but you CAN legally represent yourself I believe.

What can I do to get competent legal help though? If the case is on the face of it so bizarre that no solicitor would represent me or talk to me, then surely there must be a default mechanism? What is the "official Solicitor" that's been mentioned?
.....

All you need do is go to a good library & read up about it - that's what the McLibel 2 did.

Newsgroups: uk.misc,uk.legal,alt.radio.uk,uk.media,uk.media.radio.misc
Organization: Toronto Free-Net
Summary:
Keywords:

Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that I was listening by stealth. Back in 1990 I used to have Capital blaring out of the speakers all over the garden ("if he listens to Capital then he can't be all bad", thanks ever so much). But now I listen on my walkman on headphones with the volume turned right down. It could not possibly be overheard by any listening device, no matter how sensitive, because sound does not carry from the headphones.

Yet somehow they are still able to tell which station I am listening to on the walkman. And last night, I bravely tuned to GLR 94.9FM at around 8.45pm. Everything went well for the first half hour or so. The DJ (today GLR told me it was David Hepworth) had a "rock star spelling competition" (how do you spell Shakespear's Sister?), no trouble there. I was recording the show onto tape just in case anything unpleasant happened, as I had reason to think it might.

Around 9.10pm, it did. Here, precisely, is what Hepworth said after the song "Come Around" by the Muttonbirds (I have this on tape, and at some point will be posting the audio on my website);

"New album's called 'Envy of Angels', that comes out soon, that's the single that's already out, I would imagine, that's 'Come Around', the Muttonbirds, er, coming up after this, we got the rock-and-roll A-level, we have, I assume, Brian do we have an embarrassment of prizes in there, we do, don't we, (EMPHASIS) absolute obscene (END-EMPHASIS) amounts of prizes, there will no doubt be a riot at the back door", and that's, er, A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasized verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasized) described the disgusting sexual abuse which the harassers have been throwing at me.

Needless to say, I can't prove this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. But I shall be sending him a copy of this explanation. We'll see what he has to say for himself.

I will try to explain with greater clarity.

I am prone to have ideas of "interactive watching" by people on TV, and
"interactive listening" by people on the radio; which means as I listen to
their programme, they are aware that I am listening (because my home is spied
on, and those doing the spying phone up the radio station and tell them that I
am listening to them), and they then interject nasty remarks in what they say.
This is what I believe may have happened on Friday night with GLR, and what I
was trying to explain in my article.

It's happened before with other radio stations, most worryingly when I am
listening quietly on my walkman as happened on Friday. This time, the
interjected words were "embarrassment" and "absolute obscene". The "absolute
obscene" referred to the abuse which is currently being directed at me.

I hope that's a little clearer.

Subject: "Scandalous, Frivolous or Vexatious"
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

A couple of weeks ago I issued a summons against the BBC in my local county court, for the tort of private nuisance caused by the spying by their newsreaders on my home. My argument was that their spying had prevented me watching the news at home, and therefore interfered with my normal use of my home.

The BBC's Litigation Dept at White City have replied not with a defence, but with an application for my claim to be struck out because;

(a) it discloses no reasonable cause of action; and/or
(b) it is scandalous, frivolous or vexatious.

Their application will be heard next week. They have not made any affidavit in support of their application, nor have they given particulars as to why they consider my summons to be unarguable in law, which would be a necessary condition for there to be no reasonable cause of action.

I am more worried about point (b). Allegations are scandalous (says Stuart Sime's book) if they impute dishonesty against another party; which my allegations do, against the BBC's newsreaders. As for frivolous or vexatious, I think that will be up to me to make a good argument for the effect the BBC's spying has had on my life, and up to the district judge's opinion of my case.

Apparently seeking to have a claim struck out in this way is common practice when the plaintiff is a litigant-in-person. Even if it is struck out, there is always the opportunity to appeal. I think we could be in for a fight next week.

>you finally get this matter into court.

I'm not so fond of the threats of violence against the persistent (yet
quiet for a bit, and probably soon to restart..) spammer that is Mike
Corley. Yet, encouraging the fantasies of the mentally ill isn't
exactly healthy either. Do you go up to homeless mad people as say
things like: "They're coming to get you", or "Look out behind you?".

Smid
.....
Quite the contary Mike. Your recent posts have been no problem. By
explaining things rationally, and not spamming us, you have made more
friends than you know.

I hope that you sort out your problem, sincerely.

Yep. Just not, the, I think 180 posts, one week, when his illness
got really bad. Oh yeah, and there was only three real posts,
just repeated 60 times.

>Mike does a first class job of drawing out the real personality
>of the person hiding behind a node name. The way people react
>to Mike gives it all away.

Erm, explain this rather dubious statement.

>As for you. Don't you think it's a trifle condescending to refer
>to people as mad. I know they are homeless and without internet
>access, but maybe they are just eccentric.

Congratulations. This is my first real flame for about a year.

I try to control my anger when I come across another uninformed
naive idiot on usenet, but sometimes it goes free. We've had Corley
for well over three years now, and his constant spams of various degrees
have killed a couple of usenet groups I really rather lied. uk.media,
to name but one. I gets my goat to read another useless fucker
thinking he is a harmless eccentric.

Mike is mentally ill. He is unwilling to deal with it. He seems to
think that uk.misc is some sort of forum that MI5 reads. And it
should be avenged. He's mailbombed a large quantity of people,
because they opposed his spamming.

1. He thinks MI5 watches him through his television
2. He thinks all references to mad people, refer to him
3. He thinks all people shouting, are shouting at him.
4. He's been diagnosed as mentally ill, just not a paranoid
schizophrenic.
5. He gives not a shit about any newsgroups he abuses.
6. He goes through quiet periods, then _very_ nasty periods.
7. All evidence of this great conspiracy is laughable, to say the
least.
8. He gives internet/usenet a bad name to the media. Including
mailbombing Chris Tarrant and faxing various celebrities.

I do not condescend to him. I actually know what he does, and has done
in the past, and am frankly not too respectful of him. He can be openly
referred to as "mad" because he is. Let's check my mailbox saves:

Repost of when I thought I'd seen the last of loopy mike:

>WTGROMT (well that's got rid of me then!)

Have you actually visited his web page, and read the massive conspiracy
that is supposed to be against him? Apparently MI5 watch him, but for
no reason. They do it for a laugh. Because they can. It costs them a lot
of money, but they still do it. Reality is but a memory for this man.

>MC had seen the light and stopped spamming.

He hadn't seen the light at all. His level of spamming had got to
such outrageous proportions that we had to mount a concerted
attempt to get his account(s) closed. The reason for the lack of
spam lately is that Mike has been furiously swotting up on Law so
he can bring an action as a LIP against the BBC (all solicitors
having quite rightly and honourably declined to act for him). When
this course of action is exhausted without result, I confidently
predict that we will once again be the innocent victims of his ire
and the spamming will commence again.

Subject: I am being ignored
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

Something mildly unusual is happening. Nobody has been getting at me for the last couple of weeks. Best of all, about three weeks ago I bought a video recorder to try to get some evidence from the News etc, and despite having watched Martyn Lewis, Michael Buerk and the whole lot of them, not one of them has said anything to me in the last three weeks. And I have been listening to and recording Capital, with no ill effect. All in all, I am being comprehensively ignored.

Of course, I should have video-taped the news programmes back in 1990/91/92 (and even 93) when it was still all going on. Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent a person I am, yet I didn't have the good sense to record the programmes at the time, and it's a bit late now.

Today another avenue of exploration closed when my second summons against the BBC was struck out (basically through lack of evidence), and an order was made by the district judge saying that I could not sue John Birt again without the express permission of the court. She explained that this was for my own good, to save me the summons fees. Costs were not awarded though (the BBC didn't even really seek costs), and I am free to sue anyone else I take a shine to.
.....
It is not that you are being ignored.... it is just that as your mental health improves, so your paranoia eases.

OR...

The dark forces are gathering strength for the final battle with you...

Seriously though, it's nice to see you back - cos as long as they are persecuting you, I can relax knowing they haven't got time to bother me!

Mike Corley (bu765@torfree.net) wrote:

[unreasonable optimism snipped]

Well, that didn't last very long, did it?

Capital Radio this evening approx 8.35pm, Neil Long's programme a few moments after I switched to it (I am listening to it as I type this). The following spouted from his mouth;

"want to see Jacko in town? what a gig it's going to be, that guy is amazing, and PSYCHOTIC, but amazing on stage, 0171-4200958, on stage he's a MADMAN but he's wonderful"

God, I am so tired of this. It's been going on for seven years. When's it going to stop?

I have the above extract on tape. When I get around to it I will post it, and the Hepworth snippet, as audio files on the website. Of course, all the doubting Thomases and Smids can carry on doubting, because the mere fact that moments after switching on the DJ starts talking about "psychotic", that's not proof is it?

I wrote an aggrieved letter to Chris Tarrant at Capital and sent it off today, copied to Richard Park, Group Director of Programmes. I suppose they'll just lie as usual. Bastards, basically.
.....
The solution is surely to not have a TV, video, radio or telephone in the house, Mike. That way they can't be used to watch you.

>the house, Mike. That way they can't be used to watch you.

No. I tried that strategy in 1990/91 when I sold my television and stopped
listening to the radio. It didn't work because they got at me through
co-workers and eventually the general public.

The solution is to gather evidence by recording everything, and then complain
or sue if possible. I wish I'd recorded it all five or six years ago, then I
might be more successful in a legal action now.
.....
Did anyone else watch the X-Files on Sky last night (Sunday 13th April) and
recognise Mike's symptons in the chap with the tattoo? It was quite
interesting to see someone responding in precisely the same way, picking up
on individual words and phrases in ordinary sentences and applying parts to
themselves as though they were intended.

Not a pleasant ending though. You take care, Mike, and keep taking the
medication. uk.misc just wouldn't be the same without you now.

>moments after switching on the DJ starts talking about "psychotic", that's not
>proof is it?

No, it isn't, but you knew that anyway.

Mike, how is it that you think that this can't be a coincidence because
it happened 'moments' after you switched on the radio? Haven't you just
told us that you haven't heard a thing for two weeks? Going two weeks
watching TV & listening to the radio without a reference to 'mad', 'crazy'
or 'loony' is quite an acheivement, especially given the trashy radio you
seem to prefer.

I've just spent a lot of the weekend trying to keep a manic depressive
under control, so that she doesn't have to go back into hospital and
lose the last few months' memories to ECT. One thing I've noticed is
that manic depressives almost seek to foster their fantasies, they
enjoy the control and the high. You seem to be the same - you refuse
to answer the points put to you that explain away what you call persecution
totally - do you have the courage of your convictions to reply to this?
Or do you enjoy the attention your illness brings you?

Do please tell the *truth*. It has been longer than *2* weeks as I'm sure
you have noticed, hasn't it ?

Well I claim responsibility for the absence of persecution. When I rang
John Major's personal private secretary, not the personal political one or
any of the others in the same office, and I said you would vote for the
Conservative Party at the General Election the secretary said Johnny would
be so happy and as a sign of gratitude he rang-up the Head of MI5 and told
them to save money for tax cuts by abandoning forthwith their campaign
against you. Consequently MI5 and MI6 have been able to redeploy urgently
needed resources (i.e. manpower and telecoms interceptions) against an
international band of (*****censored*****).

On behalf of the law-abiding and decent citizens in the British islands, I
would like to sincerely thank you for your invaluable contribution to
crime fighting by your instrumental achievement in releasing badly needed
and very scarce MI5 and MI6 resources.

Many thanks,

Please don't forget it is National Election time and the news broadcasts
at 21:00 on BBC1 are preoccupied with British politics.

> Of course, I should have video-taped the news programmes back in 1990/91/92
> (and even 93) when it was still all going on.

Any particular date in mind ? I have a few in the library. You can also
purchase copies from the BBC on 0181-743 8000 (central switchboard).

> Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent
> a person I am, yet I didn't have the good sense to record the programmes at the time,

Perhaps it is for the best. Now that it is all over, you can return to
Canada. Did you manage to get your Canadian citizenship ? What did your
contracts at MI5 say about you becoming Canadian ? You never did mention
the name of your MI5 liaison officer nor of any of the others.

That's true. But as it is now all over there is no need to worry about
the past. MI5 said your file has been removed from the Registry and put
in a burn-bag so there is nothing left for anyone ever to find.

By the way, what was the URL of your famous Corley web site ?

I have to admit that it is actually mildly amusing to have newsreaders watching
you, although it is tiresome after a bit. I am currently in an interesting
situation, because after my lawsuits against them I think the BBC newscasters
have stopped watching me entirely; I also think that ITN, in particular John
Suchet, *are* still watching but they're being subtle about it (his blink
pattern followed mine).

Being called nasty words is quite horrible though, and seems gratuitous; what
do they gain by it, except to exercise their sadism?

: >I think we all ought to remember that schizophrenia is a

You have. They're not pleasant atmospheres, especially the secure wings,
which have more in common with prisons ('airlock' doors, list of 'banned'
articles, continuous observation). They have to be that way, unfortunately.

Why don't we move this into the realm of discussion rather that you noting that you know exactly what I am going to do or say (some might thing that is evidence itself of a closed mind)

What do you think about this Superluminal speed experiment in comparison to the Smarandache hypothesis?

Tunneling time in itself is expected to be zero in superluminal phenomena. Interesting.

F. Hund in 1927 noticed Tunneling in 1927. It is some pretty old physics. It is also a natural outgrowth of quantum mechanics. It is needed to explain how the sun works, and even the inflationary universe.

Your thoughts?

You better believe it. Tuesday's episode had one of its characters being
labelled as a "lunatic" with "something wrong with them". I changed channels
rapidly at this point, but in retrospect perhaps I should have carried on
watching and taped the program.

A few days ago I bought a video recorder (about time too) for evidence
gathering purposes. But strangely the TV news (both BBC and ITN) haven't
uttered a sound over the last few days. Almost as if they know they're being
taped...

>
>You better believe it. Tuesday's episode had one of its characters being
>labelled as a "lunatic" with "something wrong with them".

And?

There are many characters in TV programmes who _are_ lunatics with
'something wrong with them'. Why do you think this alludes to you?

In the eponymous book, Cervantes' Don Quixote is described as 'crazy'
'mad' and 'lunatic'. Do you think this is a reference to yourself,
albeit written by a time-travelling 17th century Spaniard?

If you accept that the character of Don Quixote can be described thus
without it being a reference to you, what problem do you have with
Peak Practice? Or do you enjoy tilting at your own little windmills?

A friend's lodger has turned out to be paranoid schizophrenic. Her
obsessions are strikingly similar to yours, she is convinced that she
is being bugged, and that students at her college are making fun of
her for being foreign. She has been looking for the services of a
private detective. Maybe Oxford has this unfortunate effect on foreigners?

I must say that I'm surviving rather well, or that's what the man
under the stairs told me yesterday.

Isn't it quite obvious, it is too early to settle on "hard facts."

Indeed, I have made no bones about my belief(s), at a future date the ether will come into play in all this, something we are simply ignoring at this date.

It seems all are aware when Einstein denied the existence of the ether (luminal ether really), and few are aware when he reneged and made provision for it (since it simply passes though the sides of any bottle which we can construct to contain it, its' makeup remains a mystery) ... you are too impatient, you want all the answers to the universe--immediately. Beware, in your haste you may choose wrong.

I have found great enjoyment in pondering "its'" remaining mysteries ... the CERN project will shed more light upon all of this ... one can always hope it will "provide all the answers", however, I think, probably not.

If this all seems rather cryptic and evasive, such is the very nature of this beast.

Regards,
JS

711. MI5 Persecution: Victor Lewis-Smith 9/5/97 (16395)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 18:47:54 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072018475169@4ax.com>
Source record: 37125
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Victor Lewis-Smith has broken the silence in his TV review column "Goon and best forgotten" in the Evening Standard (on Thursday 8/May). He said, "If I sound paranoid, that's probably because I once worked there. Eventually, I had to leave because they were all trying to kill me but, for sheer pathological hatred of the Corporation, I couldn't hold a candle to Spike Milligan".

I take this to be about me, because recently I wrote to both the BBC and Capital Radio, saying "I believe the current purpose of the harassment is to force me to kill myself to prevent the harassers, yourselves included, from being brought to justice, and last year there were several incidents of people shouting 'suicide' at me, which would appear to corroborate that view." I think VLS's words about the BBC "all trying to kill me" shows he has seen or heard of what I sent to the BBC or Capital.

Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he would explain his article?

>to leave because they were all trying to kill me but, for sheer pathological
>hatred of the Corporation, I couldn't hold a candle to Spike Milligan".

Erm, Mike, I'm a bit of a fan of Victor Lewis-Smith, ever since his days of "BuyGones". I must admit, he often likes to play the flawed lunatic evil nasty person. He's been doing it for years, with prank calls, far before your illness. Its his act. He wouldn't be VLS without it.

He doesn't like the "Goons" either. It isn't about you.

>I take this to be about me, because recently I wrote to both the BBC and
>Capital Radio, saying "I believe the current purpose of the harassment is to
>force me to kill myself to prevent the harassers, yourselves included, from
>being brought to justice, and last year there were several incidents of people
>shouting 'suicide' at me, which would appear to corroborate that view." I think
>VLS's words about the BBC "all trying to kill me" shows he has seen or heard of
>what I sent to the BBC or Capital.

I don't think Victor Lewis-Smith has worked for the BBC (or Capital) for
several years (1994 was the last time...), so the connection, is paranoia
here.

Personally, I believe VLS as a person of reasonable integrity, who wouldn't
give a fuck about you...

>Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he
>would explain his article?

Keep up the medication, not as many people read this newsgroup as you think,
even though you are now incorporating that into your illness.

Victor? Are you there?

Depends a lot on the encoding technique used. Amateur HF packet using surplus Bell 202 modems is pretty bad in terms of interference handling. COFDM with a rate 1/4 FEC is pretty good.

One needs to select a coding suited to the channel (e.g. using the coding used for getting 56 kbps through a 3kHz phone line is probably not appropriate for a ionospheric HF path).

I would venture to say that with today's technology, one should be able to get within 0.5dB of the Shannon limit without too much trouble. So, since a BPLish signal can be many MHz wide, and the putative interfering signal is going to be pretty narrow band in comparison, they can code around it.

Subject: David Hepworth (GLR) is taking the piss
Newsgroups: uk.misc
Organization: Toronto Free-Net
Summary:
Keywords:

>Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that
>I was listening by stealth. Back in 1990 I used to have Capital blaring out of

Not much changes. Today I was listening again to David Hepworth's show on GLR,
having more or less waded in on it by accident. Here is the exchange;

David: "we have executive drivetime, we have Brian in charge of the prize
cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of
prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know
if you remember him obviously still alive and kicking...."

David: "Rock and roll spelling test is your first opportunity to take advantage
of this embarrassment of prizes"

What do I read into this exchange? The laughter after the word "embarrassment"
shows they're aware of the last complaint I made on usenet (copied by
snail-mail to them). The "left hand" business is I think a coded way of calling
me a w***er (the term would be better applied to Brian and David).

I have a tape of this exchange, and will eventually get around to posting it on
the website.

It's certainly possible, but there's a fundamental problem.. the people
who know how to do it are interested in other things. There are a
variety of digital voice modems available (e.g. the AOR box), but the
algorithms are either uninteresting to a would-be experimenter or are
bound in some form of intellectual property protection (e.g. one could
graft a LPC10E vocoder at 2.4 kbps into Pactor3, but why?)

715. MI5 Persecution: Overview (496)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 19:47:24 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072019472117@4ax.com>
Source record: 37127
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Overview

What all these snatches of video and audio, and newspaper articles, have in common is that none of them provide conclusive or very convincing
evidence of their being directed against me, or forming part of a campaign against me. Other people with my illness doubtless could produce similar
non-proof if they were minded to do so.

Good, now we've got the disclaimer out of the way, we can describe precisely what it is that is on display in this part of the site. In the video
section, we have Quicktime (MPEG-4) clips of Jon Snow of ITN in action, also interviews with Ken Clarke and John Major of the ousted Tory regime. These are
embedded in the page using QuickTime. While each audio/video clip is coded to automatically download the QuickTime player, you may find it helpful to
download QuickTime from Apple's website before you start viewing the media files.

Note that each item is awarded a rating of the confidence I feel that it is directed at me, expressed as a percentage. Items with 50% or
more are probably about me; 100% indicates a "dead cert".

In audio we have MP3 files of harassment at work in Canada in late 1996, also GLR's David Hepworth not even trying to pretend that he isn't getting
at me, and a snippet of Capital. There is also an album track which I have taken as being about me. The newspapers section contains articles by Bernard
Levin on his encounter with a madman who "bursts into tears, and swears it is all
true - and it is". Also a Private Eye cover, and snippet from Victor Lewis-Smith.

I have added several recordings of abuse "in public". By Sept/1998 I had seven minidiscs of such recordings, unfortunately containing mostly very
nasty sexual slanders which I will not be publishing on this website. The recordings were made on a Sony Minidisc Walkman MZ-R30, which I purchased
in Canada in July/1997, with ECM-T140 microphone. After both the MZ-R30 and the microphone reached the end of their lives, in June/2001 I purchased as
replacement my current recording gear, an MZ-R900 walkman with ECM-T145 microphone.

Share and Enjoy! I hope you enjoy partaking in my delusions which have been recorded with high fidelity digital equipment and presented for your
listening pleasure.

716. MI5 Persecution: Ken Clarke (1), April 1997 (1719)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 20:03:12 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072020030916@4ax.com>
Source record: 37128
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Ken Clarke (1), April 1997

Certainty level: 30%

The first of two video segments from the same program, this shows
Jon Snow interviewing Ken Clarke in April 1997, during the general
election campaign. The following exchange is heard;

Jon Snow: "You say we are booming in your posters, the bust's around the corner"

Ken Clarke: "You took that from three years ago, when I was being
advised to do all kinds of mad things to stimulate the economy,
and being told that I had to take desperate measures to get it going"

At this time I was watching television almost continuously at home,
with a video recorder whirring away, trying to obtain from the
newscasters a reaction which would give them away. I think this is an
instance where it happened. Ken Clarke first darts a glance straight at
the video camera (and perhaps at a monitor next to it showing my living
room), then comes out with "all kinds of mad things", while engaging in a
facial display involving raising of eyebrows and lowering of eyelids.
To me at the time, and also now, it looked as if he was selecting a
context into which he could drop the word "mad" as a directed insult against me.

Ken Clarke (2), April 1997

Certainty level: 30%

The second of two video segments from the same programme, this shows
Ken Clarke during the election campaign. He makes the following statement;

"we have a party, and we have a Cabinet which has produced a manifesto
consistent with our policy of the last five years;
people are challenging us on the basis there's been some monstrous
conspiracy between all the politicians to guide us we know not where,
we know where we're going, we wish to be a leading influence in the European Union"

It should be fairly obvious what I read into in the above sentences.
The "monstrous conspiracy between all the politicians" could of course
apply to the public perception of closer European integration, but
I took it as referring to the conspiracy of politicians and
media people against me. Again, facial expression comes into it; as Clarke
speaks of the "monstrous conspiracy" his eyebrows twitch and it is clear
that something or somebody is being made fun of.

718. MI5 Persecution: Dimbleby / John Major, April 1997 (4165)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 20:36:50 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072020364609@4ax.com>
Source record: 37032
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Dimbleby / John Major, April 1997

Certainty level: 90%

Dimbleby interviews John Major during the election campaign. Here is
the exchange, regarding Neil Hamilton, the "sleazy" Tory candidate;

Dimbleby: "It's a direct quotation from what he said to Sir Gordon Downey
and what he said to his local newspaper, the Knutsford Guardian".
Major: "Well, heaven forfend that I should doubt what the Knutsford
Guardian actually said"
Dimbleby: "Well I should hope so"
Major: "Absolutely, it would be quite unforgivable to doubt the
Knutsford Guardian"

What I find in this segment is an assonance between "Knutsford" and "Nut"
or "Nuts". I think Dimbleby deliberately invents the play on words,
and says it clearly enough for Major to pick it up and repeat it.
You can gauge Dimbleby's intent from his facial expression of false
honesty when he uses the words "Knutsford Guardian"; and Major's reaction
follows from his recognition of Dimbleby's intent; Major smiles and says
it would be "unforgivable to doubt the Knutsford Guardian".
These are much clearer on the original video than on this Quicktime clip.

Source record: 37035

Do a search for "hotspots" maybe?

Take your laptop etc down there and see what the SSID is for the
service. It may indicate who it belongs to...

If you have LOS to the site and can arrange a high gain directive
antenna (eg yagi/disk) then you might just get connected!

Found an article about Sprint having provided a hotspot near Devine;

http://www.bbwexchange.com/pubs/2007/04/27/page1369-567277.asp

Note that this isn't the open 802.11x variety but their own $ network.

You can also try this search engine but I don't know how accurate the
results are.

http://www.jiwire.com/search-hotspot-locations.htm

Good luck!

Source record: 37033
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Channel Four TV News - 12/Feb/1999

Certainty level: 100%

I am positively, utterly, completely sure this item is about me. It's a bit subtle so the objective reader might not understand my certainty. Here is what happened. I was watching Channel Four News with Jon Snow, on the day Clinton "got off" (as it were) in the Monica-gate scandal. Snow said;

"[and we're anticipating that the President himself will make his] first comments after the trial in which he has now been cleared at around half-past seven. So we'll have more on the historic judgment, we'll also be considering [starts smiling] the winners and losers in this whole sorry saga. Now further doubts have been...."

When Snow said "half-past seven", I looked at the clock on the mantelpiece above the TV. Snow saw my glance, and in reaction to my glance at the clock, smiled. I think he was smiling at what he perceived as my self-importance.

Usually when newscasters or radio presenters laugh at me, there is an excuse for their laughter; usually they manage to find some reason for my being "funny"; their amusement is blamed on me; it is my "fault" they are laughing. And so it was with this instance; Jon Snow thought it was funny that I should be so interested in seeing Clinton, and his half-smile while reading the words "winners and losers" expresses that.

I wrote to Snow at ITN shortly after this broadcast to ask him about his behaviour; of course, he didn't reply.

if its open/unsecured, then not too much of a problem.

you will need a high gain yagi type antenna pointed at the site in question
and you *will* need some microwave low loss coax cable to feed it to a
wireless network device on your machine. That cable will probably be the
most expensive part of yoursetup..

one way to overcome loss in the cable would be to use a "wireless range
extender" with removable antennas. you could effectively use it as a line
repeater (mind you, this device isn't cheap either (about $200.00)).

you can google for wireless+internet+range+extender+antenna and see what
pops up.

722. MI5 Persecution: Chris Tarrant - 10/March/1999 (6611)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-20 21:11:08 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072021110540@4ax.com>
Source record: 37036
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed
at me when he said this. During his "Who wants to be a Millionaire" TV show in March 1999, he said;

if you're watching the show jumping up and down screaming at the telly,
remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast
show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity
of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning
over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they
questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out
that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant
would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help"
were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

For a relatively weak interfering signal, that's probably true.

That's not likely to be the case in a lot of situations, though. A strong interfering signal - say, a few watts of HF coming from a wire antenna, a few houses away from a BPL receiver - is likely to be strong enough to saturate the RF front-end of the BPL receiver. This will result in a severe "de-sense" problem - it'll wipe out most other signals within the receiver passband.

Ham (and other narrow-band) HF receivers deal with this problem by limiting their receiver passband. Single-band filters prior to the first mixer or first RF amp will keep out interferers outside that one band, and narrow-bandwidth multi-pole filters after the first mixer can reduce the impact of interfers that are closer to the desired signal.

This approach doesn't work with systems which have a "wide-open" broad-bandwidth front end, such as a typical BPL receiver, as the receiver's front end *has* to be left open to the entire bandwidth of the desired incoming signal. Many modern ham HTs have similar problems... their "DC to daylight" front ends are easily desensed, or driven into severe intermodulation by nearby VHF transmitters (e.g. police, fire, paging, and so forth).

I imagine it's possible to reduce the severity of a BPL receiver's desense problems by using a wide-dynamic-range front end... but these take more power and aren't as suitable for large-scale chip integration, and are thus going to be more expensive to build.

Even a "ham-friendly" BPL transceiver, with deep transmitter notching of the ham-band frequencies, is likely to have trouble when it finds several volts of (e.g.) 40-meter RF coming into its input terminals.

Not so. Most home and business equipment is not DESIGNED to receive
signals on frequencies where I operate (the single exception being some
cable systems that use the 2m band). Nor is it using wiring that is WIDE
OPEN to my signals. In fact the worst offenders are stereo systems with
parallel speaker leads that need only a bit twisted pair, bypassing and a
ferrite or two to eliminate all the pickup. Shielded wires may also need
toroids to eliminate magnetic pickup that goes right through the shields.

But sending an HF signal down an open power line is not just inviting interference, it's BEGGING for it, since you've given the system a very large antenna and put a sensitive receiver on the end of it. DELIBERATELY. That's like designing a gun with a plugged barrel and then firing it!

Algorithms will only help you by slowing down and using redundancy or by being frequency agile and thereby clearng off my frequency. And NO equipment DESIGNED to be a sensitive receiver at the frequencies you want to use will be immune to even stronger signals picked up by the open ANTENNA that you're using for a "transmission cable."

Dream on.

Look, I don't want to tell you how to engineer. But you've obviously got your mind made up and the facts and experience of others be damned.

This thread is beginning to switch gears, now we seem to be on the subject of jamming; jamming is obviously possible. A simple 100 MW white noise generator driving my KW+ lab amp would tear up a good chunk of my neighborhood, given the right ant/circumstances. Heck, I would probably even be placing enough of a signal on the phone lines to slow up 56K dialup modems also.

Somehow, I just wouldn't get anything out of it. And, given the few active hams in the US, the logic of logistics says, "moot point."

But, for those egos imagining themselves special, deserving and empowered above mere mortals--they are allowed to dream. <ROFLOL!>

However, it appears the world according to you will end up with laws/rules/regulations being passed to halt amateurs jamming of citizens use of the internet. With as much damage as some amateurs have done to the hobby and image of amateurs in general--I guess it won't matter too much.

You can do pretty well these days.. Consider if you're using a direct conversion receiver using a mux driven by quadrature clocks into a low pass filter like the SDR1000.. it has fairly good out of band strong

signal rejection. Granted, in band, the performance is limited by the following audio stages.

There's also a variety of receiver designs intended for GPS in a strong signal environment that avoid desensing, while still retaining wideband receive for the desired signal.

One can also do adaptive analog cancellation.

I would imagine that first (and second) generation clunky BPL receivers would have all sort of problems, but the wide open receiver with strong interferer problem is such a prevalent one, they'll have to come up with a solution that fits in their price bracket.

(or, they won't, because they don't really need BPL to actually work.. They just have to keep the BPL industry alive, and speculative future performance might be enough for that...)

I think you were lucky. I've found that the velocity factor and characteristic impedance of foam dielectric coax, even quality coax, to vary a lot more than solid dielectric cable. Apparently they don't have very good control over the foam density.

On page 7-10 of the 20th edition of the ARRL Antenna Book is a description of an off-center fed dipole. I have the necessary materials around here so I thought I'd experiment with that a bit and see how it does.

I'm a little confused about the balun.

I don't have a 4:1 or 6:1 current balun, but I do have a 4:1 W2AU-type balun and an MFJ-915 RF Isolator, what they call a "1:1 current balun" (actually an unun). I figured on connecting the latter to the former with a double male PL-259 adapter and then connecting the coax to the other end of the unun ... rather heavy, and no way to support it at the balun, and it'll no doubt droop like a 400-pound beer belly, but I guess I'll jump off of that bridge when I come to it...

The instruction sheet for the MFJ-915 says I should put the unun in the line at the transmitter end, and yet the discussion of the OCF dipole in the Antenna Book shows the 4:1 current balun at the antenna and a length of coax to the transmitter.

So, should I connect the unun to the balun as I have it, or should I connect it at the transmitter end as MFJ advises?

It does seem that if the objective is to keep RF off the outside of the coax, the unun really should go up at the antenna end.

What say you?

Hi Rick,

Yes.

So much for the short answer. With an OCF, your line is so heavily invested with a lack of symmetry that it will ring in the fields surrounding the antenna. Hence it needs to be choked every quarter wave away from the feedpoint (that is, the UnUn at the bottom of the BalUn AND again in intervals of a quarterwave).

Now as the need for suppressing Common Mode currents (which are due both to the off center feed AND the asymmetry). Unless you are feeling the pain of a live chassis, or suffering from inappropriate foldback of the transmitter (due to its circuits being confounded by Common Mode currents); then you could live with it. Then, of course, there is the perfectionist's point of view that this adds a vertical radiator to an otherwise dipole design. Yes it does. How much it contributes to the mix of fields is going to be a spin of the wheel (just as how much CM is there going to be on the line?).

One last point. The OCF resonates at pretty much the same frequencies as it would as a dipole, it is only the feedpoint Z that changes with respect to placement. Some places are great for many bands, others are abysmal, and some bring in bands that would be a nasty match for the strictly balanced dipole. If you don't snub the feedline, you are adding other opportunistic resonance's to the mix.

>
>What say you?

Based on the experience of a few of my ARES/RACES cohorts with their
OCF dipoles, I'd say that "it depends".

Putting the unun/isolator up at the antenna will tend to block
conduction of RF down onto the feedline from the radiator.

However, because the feedline is not located symmetrically with
respect to the radiator, there will be some amount of RF induced onto
the outside of the feedline by the (unequal) RF fields from the two
sides of the radiator. This will allow some amount of RF current flow
on the feedline, and (depending on your shack grounding arrangements)
might possibly allow for some amount of "RF on the case", RF feedback
into the audio chain, and similar annoyances.

If you put the isolator down at the transmitter, you may have more RF
flowing on the outside of the feedline (as it can be induced as above,

and can also flow down via conduction) but the isolator/unun will present a high impedance to this current flow and keep it away from the rig.

Due to the differences in the feedline RF current flow, you may find that the SWR as seen at the rig is better in one configuration than in the other. Which arrangement gives the better match is likely to depend on the length of the feedline, height of the antenna, proximity of the antenna to buildings and trees, and so forth.

In our Field Day use of a Buckmaster 130' OCF, the guy doing the setup ended up with the isolator located near the rig... he got a better match to 50 ohms that way, and preferred to keep the induced RF away from the rig, PCs, sound-card interfaces, and so forth.

I'd suggest that you try it both ways, and use whichever way that you find you prefer.

Hi Charles

Five miles is a long way for a WiFi link up. My suggestion is for you to
not spend any money on this "link up" till you are sure the parts you buy
will produce a good connection to the 'wireless' site.
If this was my project, I'd be looking for a 10 foot satellite TV dish
that I could mount to look at the wireless site which will be line of sight,
of course.
I am pretty sure that, if you do get your system to work, you will have a
wireless Bridge at the antenna so it connects to your computer via CAT 5
cable, not coax.

Jerry

Source record: 37051

>I use RG6 quite a bit for ham work, and the cable I buy uses a HDC >centre
>conductor. I would avoid CCS for lower HF.

For what it's worth, I looked up the specs on the Carol C5785 that is
locally available at Home Depot here in the States. It's quad-shield
RG-6 and they list the losses down to 1MHz

1MHz .26dB/100ft
10MHz .81dB/100ft
50MHz 1.46dB/100ft

According to your calculator for RG-6/U it should be
.19
.6
1.37

As a percentage difference in dB (boy that's a bad unit) it's actually
a good bit more loss at 1 and 10MHz, but in a practical sense it's
probably pretty negligible.

So unless you're going 1000 feet to transmitting antennas on mid to
low HF, I doubt it's a worry. I don't know what the price
differential is between CCS and hard drawn but i do know that cable
with about the same loss as RG-213 that costs 12 cents a foot is
pretty attractive.

As far as the original post, I picked my stuff up and made a bunch of
twelfth-wave transformers for it and that seemed to work out fine, but
I guess they're less sensitive if you put one at each end because they
would tend to match to whatever cable you're making the transformers
out of and they're very broadband too.

As far as velocity factor goes, I measured mine before I started
cutting (I built XFMRS for 2m and 70cm so I had to be sort of
accurate. It worked).

73,
Dan

Dan, You didn't say which of the RG6 cables you used. The figures you quote are very similar to Belden 1189A. In respect of 1189A, note that the regression model is based on data points from 55MHz to 1000MHz. That is either because that is what Belden supplied, or it could be that I excised some low frequency data points that were a bad fit to the model.

Beware of results where the estimate is an extrapolation. (The frequency range is red when the estimate is an extraplation.)

A cheap solution for the cable loss issue is to buy a USB wireless device and then run whatever length of "lower frequency" cable to that. I have even seen articles with these devices stuck inside parabolic and corner reflectors. About USD40-USD50 new from memory. (for just the USB device)

You can of course also mount a wireless bridge up on the tower and run CAT5 to it...

I didn't have the exact Vp number for the SIW cable; so, I trimmed it. Length came out reasonable, though. If I measure a 50 Ohm load through the cable, my MFJ269 reads 102/J0 at resonance. A little on the low side, but probably within tolerance. If it was not raining outside, I would measure the cable to see what exact length I ended up with. Bottom line is that my (late) 75 m loop did have an SWR of 1.1:1 at resonance.

The RG-59/U I am using does in fact have a stranded center conductor.
I am using RG-59/U because I am feeding a vertical (quad) loop on the
vertical side and I am running the coax away at a 90 degree angle. The
lighter/smaller coax is more suited for this arrangement. I didn't
use RG6 (which I actually have) because the reducers for the PL259
and ferrite beads I have don't fit this size coax. I figure for 3.8Mhz
that loss wasn't such a big issue...in addition to the 1/4WL section
of 75 ohm coax is only another 25 feet of 50 Ohm coax to the shack.

Good point, Dave. Any error correction comes with the expense of time, and of course slows down the transmission of the data. The packet doesn't jibe, so it is asked for again, and again, and so on. Better be a heck of a algorithim when the interfering signal is really strong as to swamp the modem's reciever.

There are plenty of examples to the contrary of the digital signal as robust entity. Experiments have been made in which a 5 watt signal in a car with a mobile antenna will knock out nearby BPL signals. 100 watts in a car will do even more damage, and a base station yet more. Other experiments have shown the so called notches being abandoned after the system was unable to send good packets. Kind of like it was getting desperate almost.

Seeing as how qrp levels into inefficient antennas can cause problems, I have to wonder what will happen during the next sunspot max.

The whole BPL affair makes me kind of wonder why shielding was invented.

And for what? a DSL speed "broadband" digital signal? BPL is a poor solution to the problems of ten years ago. It is the 8-track of broadband access.

THIS:

"There is a fourth technology rearing its head, one that uses ordinary
power lines to deliver high speed internet. Down in Texas, Broadband
over Powerline (BPL) will be delivered to close to two million people in
the Dallasï¿½Fort Worth area, beginning at the end of this year.

This technology, which obviously utilizes power lines, is said to be
faster than cable or DSL systems, and has matching upload and download
speeds (in some systems the upload speed is slower than the download).
Apparently, installation fees are minimal, since the system works via a
modem plugged into any electrical outlet.

There's always a hitch, however. The power system seems to need to be of
a smart grid type, which is two-way in that it collects data while
transmitting power. Whether that is even feasible in Nova Scotia remains
to be seen.

In any case, the wireless system used in North Queens seemed, to me, to
be fast and reliable. With large company like EastLink set to assume the
service, former and future broadband customers in the area will be able
to sign on with confidence."

This is only true if you're doing a ARQ type protocol. If you're expecting interference (and BPL certainly is), a Forward Error Correction type strategy would be a much better bet. For instance, ECC memory uses a rate 8/11 code (3 syndrome bits for 8 databits) to correct any single bit error and detect double bit errors. For BPL, one would probably choose some form of multiple carrier encoding (since interferers are likely to be narrow band) with some form of interleaving (since interferers are bursty), and a fairly robust code.

The whole art and engineering of communication link design comes from selecting that tradeoff between redundancy and reliability. Do you send twice as many bits, twice as fast, to get an overall lower data rate (e.g. a rate 1/2 code).

But this is merely an example of a specific bad implementation of BPL. There's no physics reason why one couldn't make it work (whether it's cost effective is another story).

>
> Seeing as how qrp levels into inefficient antennas can cause

> problems, I have to wonder what will happen during the next sunspot max.

The signal level received via ionospheric paths are so low, that the BPL receiver isn't going to have any trouble regardless of how good propagation is. OTOH, the interference radiated by BPL will spread that much wider.

>

But it if it provides access to capital markets for the relatively small number of people working in the BPL industry, so they can get paid their salaries and bonuses, then it's a good thing for them.

It doesn't actually have to *work* to succesfully employ hundreds of people and get dozens of people a big bonus. Sure, eventually, it will fall by the wayside and be abandoned, and all those BPL toilers will go on to a new technology or job. I'm sure there were folks who made a lot of money on Betamax cassette design and manufacturing too. (or 8 tracks, for that matter)

(Oddly, the wayside is about the only place BPL would work.. think of telemetering data from trains)

> much.

I'm just saying, given human nature and the regulations we are under, the
amateur community will be forced by the rising noise levels to resort to
higher power levels than before. I mean right now, I can get into my
nets with 25 watts and an 8-foot antenna on 80m. Put broad-band
powerline noise in the receivers of the net control stations and I'm
going to have to up the power and possibly use a more efficient antenna
to accomplish that. This is a recipe for interference, not just with BPL
but with any sensitive equipment that happens to do square-law AM
detection.

And yes, you're probably right about the politics. Who cares about
tradition or reason these days. It's all about money and me-me-me-me-me.

Crass, opportunistic crap propaganda. There is also a very stable network
in place called the telephone system which is ALREADY delivering high speed
internet to a great many homes.

This is just a $$ grab by certain factions trying to shoehorn an internet
market share in an industry they did nothing to create.

Sorry, I'm not impressed by such blathering. But I imagine a lot of naive
politicians are and the current political thinking in both our countries
seems to be to the effect that it doesn't matter HOW someone makes their
dollars as long as they make them.

For performance/price, it's certainly hard to beat
AT&T's DSL (available for $10 a month in some places)
Here at my new QTH, DSL is $15 per month compared to
Suddenlink's $40 per month over TV cable. If AT&T
isn't careful, they are going to create another
monopoly to be broken up by the Democrats. :-)

You might also want to take a look at feeding one of the bottom corners.
This will give both vertical and horizontal polarization. I found it worked
great for DX; a dog for working locals, but probably no worse than vertical
p. I subsequently added a 1:1 current balun, but don't think it did anything
relative to the original setup, which had the center conductor connected to
the vertical wire.

Good afternoon, Richard and Dave.

Thanks for the good information. I guess I will try as Dave suggests and try some different configurations and see which one works best. Probably the one I'll try first is the Carolina Windom, for which the radiating feedline (the 22 ft. from the balun to the unun) is one of the design objectives. Not really sure about the significance of the 22 ft section between balun and unun ... it's not a quarter wavelength at anything of interest... but I'll try it and see.

Or a marketing solution for what many might consider an unavoidable
problem. Problem becomes feature, problem solved, product hype enhanced,
everone wins!

Not really sure about the significance of the 22 ft section
> between balun and unun ... it's not a quarter wavelength at anything of
> interest... but I'll try it and see.

It is another proprietary antenna with secret components that prevent
reliable independent exploration of the design.

I am not saying it doesn't 'work' (whatever that term means), just that
it isn't capable of independent explanation.

Owen

It's probably because they got a good deal on some premade 25 foot
cables which were inadvertently too short, or the first one built
happened to be 22 feet off the ground, or something like that. Maybe
they had a source for 22 foot scraps?

I doubt there's anything special about the 22 ft. As many have pointed
out, it's a deliberately unbalanced antenna which radiates from both
vertical and horizontal parts (and influenced by the towers, trees, and
buildings nearby), with a nice choke at some point to keep RF from
coming back in the shack on the outside of the coax.

Actually, with nested well-behaved newsreader
software doing the attributions, one doesn't
have to worry at all about such.

If one sees:

This is especially true of saftey harnesses. During annual harness
inspection there is always someone who wrote their name on the harness with
a marker.
This harness must be condemned.

I would not worry too much about it, Just stick up something and see what
hapens. Wire is not that expensive. I have an OCF up about 45 feet and it
seems to work ok. Usually beter on 80 meters than an 80 meter dipole at 20
feet that is at right angles to it. The OCF is around 125 feet long and has
a 4:1 balun of somekind about 1/3 of the way on the horizontal wire, then
about 40 feet drooping rg8x to about 10 turns of coax on a piece of pvc pipe
and then into the shack. Seems to work ok on 80 and 40 meters. I have a
beam up for 20/15/10 so don't care how it works there, but sometimes it does
not do too much less thant he beam in some directions. The beam is usually
much beter most of the time as it is at 60 feet.

As opposed to 20 ft or 21 ft or 25 ft?

I find it hard to believe that there's an electrical reason for 22ft.
Mechanical or convenience I can believe.

Maybe it fits well with the length of their isolators, etc. and matches
a convenient pole height (e.g. isolator plus sag plus 22ft plus whatever
exactly matches 26 ft 3" or whatever the pole is)

If you loss on the cable is correct it will not work even if the computer is
wired directly to the router. If I remember correctly a router puts out
about a plus 20 db signal and the rx requires about -86db. Ive done this
between two building where a big low loss 75 ohm hardline was already in
place. just barely getting enough signal at 500 yds.

Golly....I'm unwilling to read through a litany of knee-jerk responses; did anybody notice that this BPL deployment is Current Communications? And, does anybody know that they utilize 30 -50 MHz on the overhead segments and the HomePlug protocol on the LV segments (Homeplug notches the Amateur bands).

In Ohio, Current passes >10,000 homes and NOT ONE HAM COMPLAINT. Why is this? Simple. Not in our backyard.

And don't tell me I don't know about this - I stood toe-to-toe with Progress Energy engineers in NC prior to the FCC 04-37 ruling; measured, wrote and got dirty in the process.

Where was everybody else?

BPL can be deployed outside the Amateur Bands without insult within our allocations.

I haven't seen the posting but my point is that with
a well-behaved newsreader, there is no problem and no
confusion except in the minds of the uninitiated. If
we see the following: ">> Jon Kï¿½re Hellan wrote:" and
there is nothing starting with ">>>", then we know that
what you said has been trimmed and your attribution line
has been accidentally left intact. There's really no
problem and no confusion among the knowledgeable posters
and education might be a better solution than an apology.

In the August 2007 IEEE "Spectrum" magazine is an
article titled "The Trap Technique" that tells how
qubits (quantum bits) are likely to replace
conventional computer functions such as memories.
They have a half-page graphic on quantum
entanglement on page 39 that suggests it may be
possible in the future to use the phenomenon for
transferring bits of information instantaneously.

Looking through the Radio Works catalog, the vertical radiators are
22' for 80m & 160m versions, 10' for a 40m version, 18' for an
enhanced 40m version of the Carolina Windom.

So they're figuring something, what, not sure of...

No surprise there. How many active hams live in that particular BPL
service area? Cincinnati . . . ? .

In Emmaus PA with my trusty 'ole TS-50S mobile HF xcvr. With Ed Hare
W1RFI, Carl WK3C and with Bob W3HJ and his beacoup kilobucks (HP?
Tek?) spectrum analyzer. Which very graphically and chillingly
illustrated how the OFDM BPL in that neighborhood was completely
trashing most of the HF ham bands I'd previously tuned with the TS50.
Talk about 599 crap . . !

choke at the shack, was my thinking.. I believe that the original intent
of the design was that the feedline could radiate. It's a compromise
antenna of sorts, so one can't be too picky about patterns,
polarization, etc.

I also recall seeing a diagram with choke on the ground, and feedline to
shack laying on ground (which would, of course, tend to reduce any
coupling to it)..

I suppose the real question is whether there is a statistically
significant difference in performance between this and any other random
dipole. If 100 hams put up a Carolina Windom, and 100 hams put up an
OCF dipole of some other sort, and 100 hams put up a multiband dipole,
will the variations within the groups be larger than the variations
between the groups. I suspect they will. For low gain antennas in
random installations, there's so many other factors that influence
pattern and efficiency that I doubt you could accurately measure the
difference.

Probably more important just to get some sort of wire in the air and
somehow get a match so the transmitter doesn't fold back, and not worry
too much.

Has asny testing been done on the level of signal needed to start
affecting a BPL type signal? So far, we've gotten the stories like I've
given above, which are practical if anecdotal.

> for that matter)

Since we're wearing our cynic hats today, let me toss in a theory of my
own here.

BPL, being a "last mile" system, requires that there be fiber run
almost the whole way to peoples houses. This means that unless you are
the last person or service group on the line, there is a very good
chance that fiber will be running right past your house. Signal off THAT
is what you really want. Fast, reliable, doesn't suffer from that
electrically noisy cracked insulator that the neighbor's kid shot with
his pellet gun, etc. You won't have to worry about that isolator failing
and sending lots more volts than you are paying for into the house
(likely just going to blow the device apart - but are you willing to bet
the farm on that?

At any rate, anyone give thoughts to this being just a way to get the
public utilities to run more fiber, then at a later date, take it over

commercially and service the rest of us with that?

Pure speculation that.

>
> bob
> k5qwg

My guess is that the length of the vertical segment is such that it acts as a matching segment to keep the overall impedance of the antenna at a reasonably matchable level.

That was my primary reason for choosing the New Carolina Windom, over the venerable G5RV. The impedance mismatch onthe NCW is almost never over 3:1. Which is all that my auto-tuner is rated to handle, while the G5RV can easily exceeded 5:1 on some bands. (I saw an article that did a great job of comapring impedances between these two antennas, but I can not seem to find it now)

I built my own NCW based on the measurements in this QRP Expressions article. http://www.w5fc.org/files/QRP%20Expressions.pdf

I liked it so much, I built the larger 80m version, with measurments from the RadioWorks website. I did not have a 22' of coax handy at the time, so I used a 14' piece that was left over from another project.

It seems to work just fine on everything but 17m. The autotuner tried and tried but could not cope. Finally I replaced it with the correct 22' lenth, and 17m once again tunable. So there is -something- to it.

>If the choke is effective in removing the common mode current, then the
>feedline will not radiate very much.

I believe that's not necessarily true.

If the distance between the main feedpoint, and the common-mode choke
is close to 1/4 wavelength at the frequency in question, then the
impedance "looking down" the outside feedline from the main feedpoint
will be relatively low, and a fair bit of RF current will flow on the
outside of the feedline. I think it's also likely that the choke
will have difficulty being very effective in this location, as it will
have to have a very high choking reactance.

If the distance from feedpoint to choke is close to a half-wavelength,
not much current will flow.

If the distance is somewhere in the middle, the outside-of-the-
feedline impedance will be rather reactive. This reactivity may
interact with the reactivity of the radiator... e.g. if the feedline
impedance is inductive, and the radiator's impedance is capacitive,
the two might tend to cancel out to some extent. This could have two
effects - a significant amount of RF current flow on the outside of
the feedline, and (perhaps) a better impedance match at the
feedpoint/balun and a lower SWR as seen by the rig.

It's possible that the 22' vertical-section length for the Carolina
Windom was selected, after experimentation, to provide the best
matching of the antenna/balun/choke system to a 50-ohm transmitter on
certain bands on which it would otherwise be difficult to match.

That would be one possible implementation. There are others. For
instance, MultiTone FSK is another. Multitone PSK like Link-11/TADIL-A
(which has been used for HF comms for decades) is another.

More, I was thinking that the early BPL implementations used fairly
simple receivers and transmitters which aren't particularly interference
immune. Technology, particularly for digital processing, advances quite
quickly.

This would be complicated by the fact that there's not just one "BPL
type signal" or, more accurately, one "BPL implementation". One could
design a system using, say, BPSK that is hideously unrobust and another
system, also using BPSK that is very robust.

For instance, BPL doesn't need to have good doppler tolerance, and could
rely on recovering a very stable frequency reference, something that
wouldn't be practical in, say, a cellphone.

Hi,

I'm trying to determine if using an antenna analyzer is technically a violation of the telecommunications Code of Federal Regulations. Typical antenna analyzers inject a incident CW or sweeping CW to the antenna and measure its return loss (reflection). Very few frequency bands have a CW or sweeping CW as their allowed modulation type. The way I see it is that by using an antenna analyzer you are intentionally radiating an improper modulation type that was allocated for the band and therefore you are in violation of the Code of Federal Regulations.

Anyone have any thoughts on this topic?

Thomas Magma

By your logic a noise bridge would also be illegal. However in most places
there is a limit on the amount of power one can use before it requires
a license. Since an antenna analyzer puts out a few microwatts, if that,
no one seems to care.

I do not have the capability to measure the power level of mine, but I
expect that it is less than a regenerative receiver. It would be easy
to test, place one on an antenna and try to tune it in with a portable
receiver. If you can hear it, move away and see how far it goes.

Geoff.

789. Leaky Coax V's Wire Antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-22 22:37:04 UTC
From: David <dhuisman@bigpond.net.au>
Message-ID: <kU2zi.24525$4A1.9103@news-server.bigpond.net.au>
Source record: 37003

I have an application where I want a vehicle to detect whether it is entering or exiting a particular area in a building. The accessways are typically about 5m across and there have been problems using infra-red, reflective tape and RFID technologies.

I would like to try 2 Stips across the accessway that are spaced about 1m apart and act as antennas for a 915MHz transmission.

One strip would transmit the first zone ID and the other the second zone. The Receiver on the vehicle would use the RSSI and Zone ID to determine which way it was travelling.

In theory I think this may work. I am considering a prototype using leakt coax as the strip but the only type I can source here in Australia so far is 28mm diameter (cause a bump in the vehicle by the time this is placed into a conduit to protect it).

Would it be feasible to use simple metal strips as antennas that are tuned to length to be exact multiple of 1/2 wave ? I would then expect that there would be a peak signal every 1/2 wave along the length of the metal strip.

The receiver antenna on the vehicle will only be around 500mm above the ground so the transmit power can be low and high loss in the strip can be tolerated. The lower the power the better as it will minimize interaction between the strips.

Thanks for your comments

Regards

David

Low power test gear is listed as a permitted form of radiation. While a
signal generator is permitted for use as a test instrument, it would not be
legal to use it for say a transmitter on a ham band that you are not licened
to use.
YOu could legally use it for a ham band transmitter if you followed all the
other part 95 rules.

Hi Ralph,
I don't mean to sound offensive, but do you know for a fact that low power test gear is a permitted form of intentional radiation? I wonder what constitutes 'low power'. Do you know where this is written so I can research it myself?

Thanks,
Thomas

>no one seems to care.

My understanding is that the popular MFJ antenna analyzers generate
around 2 volts RMS of RF at their output port. This works out to
around 80 milliwatts into a 50-ohm load... comparable to what a small
QRP transmitter would deliver.

>I do not have the capability to measure the power level of mine, but I
>expect that it is less than a regenerative receiver.

I think that it's more than you might expect. These analyzers don't
use a tuned detector - they use a simple diode detector (admittedly
with low-threshold / "zero bias" Schottky diodes) and they need a
reasonably hefty signal. I've heard that there are some analyzers
which use some sort of mixer-and-filter arrangement to sample the RF
(thus allowing the analyzer to reject incidental off-frequency RF such
as the AM broadcast-band signals that render MFJ analyzers rather
useless on 80 and 160 meters) but I haven't seen one myself.

As to the issues of legality - IANAL, but I think that there's
probably a way to justify their use under the CFR.

For one thing: CW modulations are authorized under Part 97 on almost
all of the ham bands (everything other than 60 meters, I believe).
Stick to the bands on which you have operating privileges, and you're
probably safe there. Feel free to turn the analyzer on and off to
send your callsign in CW at the end of your test, if you're feeling
cautious :-)

For another: Part 97 specifically authorizes "test transmissions" on
any band authorized to the control operator (with restrictions on
pulse and spread-spectrum test transmissions).

For a third thing: it's quite possible that these devices would emit a low-enough power level that they would qualify for use under Part 15 "intentional radiator" standards... and such devices are permitted to operate in most frequency bands. Such devices to have maximum-power limits, which are measured in microvolts-per-meter field strength at a specified distance - limits and distances vary by frequency band.

For a fourth: they *might* also qualify for legal use under Part 18 (Industrial, Scientific, and Medical Equipment). These devices can also operate in most frequency bands (although there are several subbands which are specifically authorized for them and are thus recommended), subject to maximum-field-strength limits similar to those specified for Part 15 devices.

I doubt that the FCC has the inclination, desire, or resources to try to forbid or limit the use of antenna analyzers. If they did, they'd have to start raiding labs all over the country and confiscating multi-thousand-dollar vector network analyzers, S-parameter test sets, and so forth. The Benevolent Association of Agilent And Anritsu Equipment Owners would no doubt start writing harsh letters to their Congressmen :-)

In practice, I suspect that you're quite safe in using such devices as long as you aren't causing harmful interference to licensed users of the bands in question... and if you believe that you are, you should of course cease transmission immijitly!

A network analyzers is not marketed as an antenna analyzer, or even an intentional radiator for that matter. I have a signal generator, an amplifier and an antenna in my lab but it does not mean I can sweep the entire LF to UHF bands at any wattage.

I was just looking through Part 18 and it really is unclear to me, however one thing was clear to me, ISM devices are prohibited for use in certain bands. One of which is search and rescue. So now how can I test my ELT antenna installation on my aircraft if I'm violating FCC rules?

Thomas

Thomas you can start around here in the Part 15 rules.

[Code of Federal Regulations]
[Title 47, Volume 1, Parts 0 to 19]
[Revised as of October 1, 2000]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR15.3]

[Page 676-679]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS COMMISSION

PART 15--RADIO FREQUENCY DEVICES--Table of Contents

Subpart A--General

Sec. 15.3 Definitions.

(dd) Test equipment is defined as equipment that is intended
primarily for purposes of performing measurements or scientific
investigations. Such equipment includes, but is not limited to, field
strength meters, spectrum analyzers, and modulation monitors.

Then you need to get a better signal generator.

You test it during the time window when testing ELT's is allowed.

Since such devices have been around in one form or another for longer
than most everybody currently alive and the FCC has shown no interest
in them to date, the empirical evidence is the FCC doesn't care about
them.

And for the nitpickers, yes if you hooked one to an antenna and left
it turned on for days, someone might start caring.

However my measurements of an MFJ-259B and an MFJ-269 both show constant output throughout the frequency range of +7.0dBm +/- .5dB which is 5mW and not 80mW.

Interesting - thanks, that's quite a bit lower level than I had
[obviously,mis-]remembered. That'd be about .5 volts RMS rather than
2 volts RMS, IIRC.

It could be if it causes interference, especially if the interference is
done with intent to disrupt communication. This could have a varying degree
of seriousness depending on whether you are trying to disrupt you
neighborhood CBer or jam communications at an airport.

I am just a bit oversensitive to new age these days. Some of you may
have noticed what our princess has been up to. For the rest of you:
She's running an expensive seminar about how to talk to
angels. Apparently, no news from Norway has been as widely reported
internationally for years. Embarassing!

Folks, don't ley your daughters play with horses. They might fall off,
head first. This must be what happened to the princess.

Is that just to Oslo, Bergen , Trondheim and immediate surroundings
or also to the smaller places and rural areas ?

If it is viable for power companies to run fibre to the home in rural
areas BPL will become a non-issue.

Here in Scotland fibre is carried by 425kV system pylons but it is only
used for trunking . However fibre is being installed between telephone
exchanges (by a Tsjech/Slowakian company)

Nope the reg is very clear on this issue though I know it has done no harm
to harness.

The harnesses dont have a sewn on label but we do have some wire on tags
that are applied after inspection.

That explains why it didnt work so well as a RX VFO.I needed about 13db I
may try again with a little amp.

I wonder if the vacuum tube dip meters
aren't the most powerful signal sources
we typically use to explore antenna
characteristics, especially when the
coil is tightly coupled.

73,
Chuck

This is how the power companies got involved in the business here as
well. But one in particular (www.lyse.no) has expanded into consumer
access.

If you listen to the signal, it's quite unstable. So probably not very
useful as a VFO.

I just wanted it for test puposes to check out a receiver Ive been working on for 4 or 5 years. I think the osc on it may be weak too.

This does not apply to the newer 406 ELT's that are currently being sold,
and which are monitored by very sensitive LEO, MEO and GEO satellites. A
band that is also recognized and protected by the ITU.

Thanks Ralph,

I have the CRF in front of me and can see where test equipment is defined.
However, I can seem to find where it says that test equipment is exempt from
any sort of intentional radiation at any power levels.

Do you know where?

Thomas

Hi Jim,

I'm not necessarily worried about interfering, disrupting or jamming other receivers in the area, a fast sweeping 3 or 7 dbm CW would not likely interfere. I am worried about what is legal and what is not legal. Regulatory bodies such as the FCC/ITU do not use statements or issue licenses under terms 'it's not likely to' or 'its not much of a concern', they prefer to issue specific modulation types and field strengths.

We have had regulation of RF emissions since 1912... I have been an
active ham for 45 years... I have read most of the back issues of QST
over the years, clear back to the start.... I keep up (mostly) with
regulatory and enforcement actions that affect hams....
Never, ever, have I run across an action by the FCC against a ham for
using a piece of test gear that radiates low power signals...
When that does happen perhaps it will be time to discuss it...

Asking for clarification is absolutely the last thing you want to do.
Have you never heard of 'Let sleeping dogs lie'? Most authorities (at
least in the UK) have a policy of "If in doubt, say no". Alternatively,
the response may come from some junior employee who has no idea what you
are talking about, and in case he/she is wrong, will simply give an
unconsidered "No" as a 'safe' answer.

I agree with you, however this is not the intelligent answer I was looking for.

I like to think there are people that participate in certain newsgroups that are more knowledgeable on specific topics than I am. If I start asking questions to the FCC or ITU it will be a huge drawn out process. I was hoping someone knew the answer so I wouldn't have to go that route.

Where the intelligent response would have been "What about FAA rules
or CFR 91.207(2)(d)(4) (where you would struggle to qualify as an
inspector)?"

As I have been authorized to work under both authorities (I've done
plenty of Navigation Aids, transmitters and Flight Recorders) that
particular question seemed to evidence a struggle in the tarpits.

From: "R.K. AJ4BF" <none@dev.nul>
Message-ID: <230820071706105637%none@dev.nul>
Source record: 36942

What is the effect of having a semi-circle of radials beneath a vertical antenna instead of a complete circle? For example if your vertical is near a property line. I vaguely remember reading that the azimuth pattern would no longer be omni-directional and there would be a change in the elevation of the main lobe. But my memory is hazy and I can't find anything on the web.

Perhaps not against hams, but cases of FCC enforcement actions against commercial users of test equipment have occurred. A typical case is radiating on an antenna test range with a bit too much power, or without the necessary experimental Part 5 license. There are also cases of companies getting tagged for doing things like testing a radar, but that's something designed to radiate, not a piece of test gear.

The general rule is, if they can't detect it at the property line, you're probably legal.

831. Source for large #31 toroids

Newsgroup: rec.radio.amateur.antenna

Where is a reasonable source for a small number of 2.4 inch #31 toroids?

Various catalogs list #43 in this size, but I cannot find #31.

The 160/80m choke described in K9YC's paper sounds good. I expect getting 7 turns of RG213 or "buryflex" through these toroids might be an interesting exercise.

> can't find anything on the web.

Hello,

When your radiator is about a halve wave (or multiple of), the azimuth
radiation pattern is mainly determined by the radiator (as current fed
to radial network is far below the current in the radiator).

I assume that you radials are close to the ground or touching the
ground (soil).
In case of shorter antennas, current in the radials will be
significant. In that case you are right, the azimuth pattern will no
longer be circular. There will be more radiation in a direction
opposite to where are no radials. I believe that you will not notice
the difference between semi circular or full circular radial network
because of directivity.

Regarding elevation pattern, the soil properties will be dominant. So
I would not worry about your ground network.

The real part of the ground impedance will be higher (with respect to
a full star configuration), so depending on the radiation resistance
of you vertical, the radiation efficiency may be lower.

Best regards,

Wim

Jim, I am a pilot, etc. I am aware of enforcement actions against radio repair stations for radiating excessive power on the same frequency as the VOR on the field, etc... But, I was very specific in my comments... No enforcement action against a ham for using test equipment - ever - insofar as I know... This is so unlikely as to equal betting on the Megamillions Lottery this weekend, for several reasons... The first reason is that we are licensed to radiate those emissions in the first place... The second reason is that unintentional interference must be accepted in the ham bands per the regulations... The third is, Rily has a sense of humor...

Why? Are you seriously worried about getting arrested for using an antenna analyzer?

It's really time to step back and take a deep breath, Thomas. If you can get wrapped around the axle about this non-issue, there are plenty more legalistic pitfalls in amateur radio to give you an ulcer.

> I like to think there are people that participate in certain newsgroups that
> are more knowledgeable on specific topics than I am.

If what you are looking for is specific written words blessing the use of antenna analyzers, I doubt that such a thing exists. Then again, I haven't looked for anything either. People have been sending tiny amounts of RF up their antennas to find out things about it since before Methuselah, selling and buying instruments of apparent contraband without anyone getting too excited. 'Til now.

Respectfully suggest that you start looking for your evidence. Most of us are happy to assume that when used for the intended purpose, an antenna analyzer is legal and acceptable. If you think it might not be - and I have to assume that you do, do the research and prove it.

That's my answer. You can decide if it is intelligent or not ;^)

> If I start asking

As Homer Simpson once mused:

"Can God Make a Burrito that is too hot for him to eat?"

It was a well deserved citation against that radio repair station. And the antenna range too. But neither of those are the same issue.

But since we have descended from the sublime into the ridiculous, I have noted that it is occasionally possible to accidentally make a QSO with another OP while connected to a dummy load. I've done this a number of times on PSK31.

Are there specific rules and limits to the radiation from dummy loads? And if not, are Dummy loads illegal?

841. Cushcraft Vertical Trap Consistency - Is there a trick guys?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-24 14:45:07 UTC
From: Kevin Hastings <myfamilydotcom@hotmail.com>
Message-ID: <46ceeefb$0$4068$9a566e8b@news.aliant.net>
Source record: 36955

I've spent 2 months or so of tweaking an older Cushcraft ATV-5 5-band vertical with a friend's MFJ analyser and have had this thing exactly where I want it several times now. After tightening things down and putting vinyl electrical tape on all traps and section joints (where it seemed to make sense) it would look fine for a few days to a week.

Then the resonant points of some bands would shift up to no-man's band seemingly overnight and stay there. I suspected poor screw conections at the traps, and so have been adding a stainless steel pipe-clamp connection just above and below the trap for improved connection. Made things better I thought - now 1-2 bands are just out of whack again.

There's always moisture inside the trap when I disassemble the thing, so I'm wondering if maybe I shouldn't be trying to tape up the traps at all - maybe they are retaining water or something that is affecting the capacitance. Each trap has a drain hole at the bottom, and the aliminium pole itself has drain holes every now and then that I'm trying not to interfere with.

Is there a trick, or some practical experience here that you can share?

I've had a lot of fun experimenting with this in any case, but winter's coming...

Thanks,

Kevin VE9-XYZ

> can't find anything on the web.

It will have some effect, but less than you might think. I put up a vertical on one side of my yard, and put in a set of radials that were as long as I could get them in every direction. Some of them aren't perfectly radial either, there is the occasional bend in some of them.

It's one of those things that if possible, they should be arranged in a perfect radial pattern all around the antenna. But as Hams, we don't always have the chance to have things perfect.

I would say that if you could get some short radials down in the deficient direction it would be best, but if not, put it up anyway and have some fun.

I have an Oak Hills Research WM-2 QRP Wattmeter, which includes a
0-100 milliwatt scale.

With an MFJ 269 Antenna Analyzer hooked to the transmitter side of the
wattmeter, and an MFJ dummy load hooked to the load side of the
wattmeter, I get a reading of 3 milliwatts forward, 0 milliwatts
reflected.

Not sure whether the FCC is concerned with signals at the 3 milliwatt
level...

Hi Kevin,

Is this an elevated vertical, or ground mounted?

If elevated, do you have the transmission line choked at the
feedpoint?

If ground mounted, what kind of radials system do you have?

Is there a way to tell the difference between series 1-2 and series 3-5
without taking the rotor apart?

I already took the rotor apart once, to try to find some identifying marks
on it to differentiate between Ham-M and Ham-II-IV, and had one hell of a
time getting it back together... ended losing about four of the ball
bearings, then when the XYL asked what I was doing crawling around on the
floor and cursing and I showed her what I was looking for she disappeared
and came back in a few minutes with a small bowl full of ball bearings and
said "Will any of these fit?". Sure enough, they were the EXACT size.

Still had an awful time getting it back together though and I really don't
want to do it again.

So, if there is a way ... perhaps some measurements I can take with an
ohmmeter ... that will show me if I have a series 1-2 or series 3-5 that
would be a great help.

Thanks...

Kevin my Cushcraft (MushCraft (;-) R-7000 had a similiar problem. The trap wires are aluminum and connect to the trap shell where a intermittent connection would occur. Using a slightly larger screw and a star washer cured the problem. Don't know if this applies to your ATV-5 or not.

It IS possible to radiate from a Dummy Load, enough energy to commuicate
with another station. Example. Years ago, I was a Traveling Radioman
for the old Northern Radio Company of Seattle, Washington. I had a
Northern N550 MF/HF SSB 150W PEP Transceiver on the testbench connected
to a Bird 1 Kw Dummy Load. I was doing a final tuneup on the
Transmitter, which was Crystal Controlled, and one of the channels was
KMI @ Point Reyes California, the AT&T HighSeas HF Station for the
Pacific. As I was testing with a two tone Audio Test Signal, I heard
the KMI Operator come back with a "Who the heck is on my input Freq
on KMI-1201?". We carried on a nice chat for about 5 minutes, and I
called him on the Landline after that for another 30 minute chat. He
said he routinely got signals from Radio Shops, doing tuneups on
his Calling and Working Frequencies, when the Band was Wide Open.
His Receiving Antenna Array was a set of Phased Rhombics, steerable
over a 270 degree Arc to the West.

Hi Kevin:

Don't cover up the vent holes. Water is a poor dielectric and will de-
tune the traps. Also it will promote corrosion.

==========
Earlier this week I have done a similar exercise with a Butternut HF9V
vertical, using a MFJ259B analyser. Initially I got nowhere,although
nothing was 'visibly' wrong.
However ,when stripping the antenna I found that because of dissimilar
metal corrosion (stainless steel bolts,nuts and washers to aluminium
tubing) a white aluminium oxyde powder had developed in between the
stainless steel / aluminium contact areas . Following removal of this
and re-fitting all components the antenna can now be adjusted and tuned.
Sofar ,80 metres and 17metres are fine (SWR is around 1.5 : 1) ,the
other bands still to be done. When finished I'll cover all the spots
with above contact areas with (Finnigan's Wax Oil)
This wax oil is widely available in the UK and is primarily meant to
protect the chassis of cars . It is also very suitable for protecting
metal components of antennas especially in coastal areas near salt
water . My QTH is 30 metres (100 ft) from a salt water beach.

Kevin,

In addition to the other responses at this time...

I note you used an MFJ analyser, not further described. Assuming it is
the MFJ259 or like...

Did your VSWR readings with proper transmitter reconcile with the MFJ?
If not, I would favour the transmitter VSWR readings over the MFJ (the
wideband detector in such instruments is too easily disrupted by other RF
sources to depend on them absolutely).

Regarding tape, remember that any measure that you take to prevent ingress of water is also likely to prevent egress. Worse, you may not prevent vapour being drawn into the trap, but may prevent condensate leaving and so build a water trap. Drain holes aren't always as effective as we would like (blocking for various reasons), but I would not obstruct drainholes. Indeed, period clearing of drainholes is a good idea if convenient.

I see others have raised the issue of the reliability of internal connections in the traps, another common problems with those antennas.

But Fair-Rite doesn't sell direct.. you need to order from a
distributor, and many have minimum orders. Lodestone Pacific (I think)
has a $20-30 minimum order, but you'd better have the exact Fair-Rite
partnumber..

It's very difficult to hermetically seal a large surface-area container from moisture ingress. What happens is that, on a warm sunny day the container heats up, causing the inside air to expand , pressurize the container somewhat, and leak out. Then a thunderstorm blows in and cools the container suddenly , causing the inside air to quickly contract, pulling a vacuum and consequently sucking in some of the humid outside air. The humid air that was sucked in then condenses back to water, which remains trapped unless some reasonable size 'weep' holes are provided at the lowest point.

The moral of the lecture is that, unless you have taken substantial measures to guarantee a hermetic seal, you should have drain holes.

Quiet sun radio noise is often used for measurements of radio receiving systems. The radio flux from the quiet sun is a known signal in that it is measured and reported at observatories around the earth, and therefore provides a basis of assessment of radio receiving systems.

I have been playing around with a little online calculator to calculate interpolated recent solar flux data for amateur radio UHF and microwave bands from published observations.

It is at http://www.vk1od.net/qsrf for those who may find it useful.

> level...

Most if not all the part 15 rules are defined in terms of field strength, not power. 3 mW is way, way more than enough to exceed some of the limits on some frequencies, when connected to even a poor antenna. For example, Part 15 shows, in 15.209, that intentional radiators aren't allowed to produce a field strength greater than 100 uV/m (with exceptions) at 3 meters from 30 - 88 Mhz. 3 milliwatts will produce *1,000 times*, or 60 dB greater than, this amount when connected to an isotropic antenna. Hook it to a dipole to get another few dB. The limit for class A digital devices (one class of unintentional radiators) is the same in that range, according to 15.109. So don't think that just because you consider a signal to be QRP that it's legal.

That said, I agree that chances of prosecution are zero for using these devices unless serious and/or intentional interference results. And I strongly agree with the folks who have said that the last thing you want to do is force a specific ruling on the matter from the FCC.

I wrote a little article to inform people in the BPL debate... it started
out as:

How much radiated power does it take to create an S9 signal?

Try this quick quiz:

What is the EIRP of a 7MHz transmitter that results in a S9 signal at a
receiver located 1km from the transmitter, is it closest to:

1. 5 Watts;
2. 1 Watt;
3. 300 milliWatts;
4. 5 milliWatts;
5. 3 microWatts.

Answer: e, it is just 3 microWatts EIRP.

Remember that it takes less than a nanoWatt EIRP (ie 10E-9 Watts, a
thousandth of a millionth of a Watt) of leakage of radiofrequency energy
at 7MHz from BPL enabled power lines 10 metres from a dipole to cause S9
level interference.

Are you ready for BPL enablement of your home and neighbourhood?

861. MI5 Persecution: Chris Tarrant - 10/March/1999 (496)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-25 05:53:33 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072505534019@4ax.com>
Source record: 36975
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed
at me when he said this. During his "Who wants to be a Millionaire" TV show in March 1999, he said;

if you're watching the show jumping up and down screaming at the telly,
remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast
show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity
of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning
over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they
questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out
that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant
would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help"
were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

Nicholas Witchell - 10/April/1999

Certainty level: 100%

This clip is of Nicholas Witchell reading the BBC2 evening news at 7pm on Saturday 10 April 1999. You have to understand that the psychopaths of
the Security Service consider their abuse of me to be "so funny"; and central to their persecution of me is their inducement of their "bought
journalists" like the BBC's Nicholas Witchell to laugh at me on television.

So in this clip we see Witchell smirking and grinning while he reads the news. Only part of the news broadcast is shown in the clip; preceding it,
Witchell's upper lip quivers in mirth for several minutes, until his entire mouth twists into the uncontrollable smile shown in this clip,
through the excuse of a weak non-joke about sports fixtures.

863. MI5 Persecution: England expects every man to do his duty (2942)

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-25 06:47:46 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072506473785@4ax.com>
Source record: 36977
Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

"England expects every man to do his duty"

Certainty level: 90%

This video clip portrays a fairly-certain case of unpleasant MI5 harassment; because of context, surrounding events,
not just this one happening. It's the first time an MI5 agent has been caught on video, and, presumably to their chagrin,
their paid agent is either engaging in an onanistic practice, or, more probably, pretending to do so, in order to
carry out an act of harassment.

The background is as follows. In late June 2000 I had posted the following message to Usenet, about MI5's making
obscene noises at me on several recent occasions;

>From: bu765@torfree.net (Mike Corley)
>Subject: relax, don't do it (mi5 again)
>Date: 22 Jun 2000 00:00:00 GMT
>
>you will recall that a couple of weeks ago I was supposing what MI5 were
>doing with their 'single'handed' posting antics at 2am
>
>exciting stuff
>
>so about a week ago someone rings me up at home.... 'is that Emmanuel
>Goldstein?' then he phones back the following day and goes 'huaaaagh' on
>the phone before dropping the handset in excitement
>
>and a day or two later, just coming out of our house to put something in
>the rubbish bin, a pair of blokes over the other side of the road, again
>start making orgasmic noises
>
>I'm not paranoid enough to record minidisc when I pop out for a few
>seconds..... but perhaps I should be

The video clip, which was captured on 1/September/2000, is the culmination of that thread of harassment. You
have to understand that MI5's abuse is in threads; they choose a topic, and then continue with it for months
and years. Sometimes they drop a topic, usually to be replaced by a worse one, and you never hear of it again.

If the person in the video clip were not an MI5 agent, then he would deserve privacy, despite carrying out a real

or feigned act in a public place. But I am almost 100% sure, because of context, that this man was one of their
operatives, which removes any consideration of privacy from his act. He is facing away and cannot be clearly
identified from this clip. I've never seen this man before or since, but that is true of most other such incidents.

C4 SnowMail - January/2001

Certainty level: 50%

In January 2001 I signed up for Channel 4 TV News's email service SnowMail, under an anonymous email address.
Quite soon Jon Snow and others started getting at me in the SnowMail bulletins, so I promptly unsubscribed.
Here are three distributed messages which may be intended to be against me; I have given these items a joint
probability of 50% only, since it is quite difficult to be sure these are against me, although I think they
may well be.

First item is from 5 January 2001. "Back passage contacts" might genuinely be about Labour were communicating
in a shielded way with ITN; but it may be about Snow's covert communications with me on his programme and in
this bulletin; and it's a slightly strange thing for him to say, it suggests the human body's back passage.
"I wish they'd come and talk on our website".... Snow knows I'm subscribed to his mailing list, and he may be
encouraging me to talk to him by email; again, if that comment were genuinely about Labour, then it would be
a strange thing to say, since the politicians talk to Snow by phone and on his programme, so they wouldn't talk
to him by email; my suspicion at the time is that he was trying to persuade me to talk to him by email,
so he could decently lie that my thoughts of reference were incorrect.

From: "Snow C4N, Jon"
Subject: Channel 4 News briefing
Date: Fri, 5 Jan 2001 17:15:06 -0000
MIME-Version: 1.0

January 5, 2000

Good afternoon dear viewer,

Well the 'snowmail' drew a little ire from Labour HQ yesterday. A sensitive call at 6.35pm from my friendly
mentor there sought to correct the impression I gave in yesterday's missive that in some way Labour was bounced
into naming these latest millionaire donors. Well I'm afraid they were...rest assured Paul Hamlyn would not have

been named without the diligent sleuthing of my colleagues, and had HE not been named neither would these latest two.

The only serious inaccuracy I must plead to was the promise that we would put these matters to a 'senior Labour
person'...alas none was forthcoming...I shall make no such rash promise again. My same mentor was on the phone again
during last night's Channel 4 News urging us to 'get some reality into the programme'. I fear we may have touched a
sensitive nerve...and the election campaign has not even started, or has it? I shall try to keep you posted with these
'back passage contacts' as the campaign unfolds..from all sides. I do wish they'd come and talk things over with all
of us on the web site...here's an open invitation...

So to today:

Harold Shipman murdered as many as 250 people it now turns out. But he is never to be tried and relatives who seek
closure to their uncertainties will never reap satisfaction..we have the DPP, the Chief Medical Officer and a solicitor
for aggrieved and bereaved families on the programme..the world's second-worst mass murderer..can he be allowed to
escape further action?

Sending private/sexy emails in company time gets workers the sack..Big Brother spies on office premises..is electronic
life in the work place getting out of hand? We explore what we can...and if you are not sure what you can and can't
send, our site spells out the legal dos and don'ts and gives you the chance to put your views to us.

The CIA publishes its risk assessment for the world in the coming years..beyond the CIA itself, what's the biggest
threat to life and liberty? Find out on Channel 4 News..and a major encounter with a man expected to take a top job
in the Bush administration...

And a sumptuous piece from Nicholas Glass in Valencia..a city transformed by a brilliant young architect for half
the price of what the Dome cost us.

Lots moving, see you at 7.00,best as ever,

Jon Snow

The next contact was on 11 January, with the unsubtle words "the lunatics have taken over the newsroom"
from Krishnan GM. The phrase needs no explanation as to why it might be a dig at me.

From: "Guru-Murthy C4N, Krishnan"
Subject: Channel 4 News briefing
Date: Thu, 11 Jan 2001 16:56:25 -0000

MIME-Version: 1.0

January 11, 2001

Good Afternoon. Jon's away so the lunatics have taken over the newsroom. I am joined by Samira for tonight's show.

The Depleted Uranium confusion deepens. What did Ministers and senior officers know about the risks to soldiers?
What did they tell others? And why the lack of candour over the recent documents that have surfaced? Having
dismissed the army report leaked yesterday warning of the dangers of exposure to DU as written by a trainee and
littered with mistakes, the Ministry of Defence now accepts it was written by an experienced officer.
But they won't say who. More awkwardly it emerges that senior officers decided a month after it was written that
the report should be circulated to all personnel likely to come into contact with DU. But was it? Nobody seems to
know. Our Science Correspondent Andrew Veitch has also visited the lab in Oxford that could begin testing
veterans for Depleted Uranium within six months, but they have had no contact from the government as yet. From
the Tories, Mr Duncan Smith is likely to join us. And we have Defence Secretary Hoon coming into the studio to
answer the obvious (and not so obvious) questions.

No interest rate cut today from the Bank of England, but could it be next month? As real fears are raised about
the likelihood of recession in the US how could it affect us over here? There's been a recent consensus that
Britain could weather the storm instead of falling into the usual pattern of shadowing American trends. But how
realistic is that? And what about all that inward investment we rely on from the States? Liam Halligan has been
looking at just what impact economic downturn across the water would have on us.

The former Bosnian Serb President Biljana Plavsic pleaded not guilty to charges of warcrimes including genocide
today. She was number two to Karazdic and a reputed hardliner during the "ethnic cleansing" of Bosnia.
But has a deal been done on her sentence if found guilty? Just why did she get on a plane and give herself up
to the Hague War Crimes Tribunal? Nobody seems to have any explanation. Her lawyers are asking for special
accommodation and even the possibility of bail. Gaby Rado is there and joining us live is the first Prosecutor
in the Hague Judge Goldstone to discuss whether plea bargains and deals are the only way to get the real villains.

Also the astonishing news that scientists in America have bred the first genetically engineered monkey. What will

they be used for and what's the next step? Does anybody really believe they won't do it to humans before too
long? Julian Rush will have details.

All that and loads more at seven. See you then, I hope. Krishnan.

The third and final item is from 24 January, shortly after which I unsubscribed from SnowMail. Again, it is difficult
to be sure if this item refers to me; it may do, it may not do, 50% captures the possibility. Snow refers to
"third leg of [Blair's] political footstool". In English culture "third leg" indicates one's male member;
Snow's phrase may be a sexual reference, of which there were others around that time.

From: "Snow C4N, Jon"
Subject: Channel 4 News briefing
Date: Wed, 24 Jan 2001 16:37:36 -0000
MIME-Version: 1.0

January 24, 2001

Good evening dear Channel 4 News viewer,

There are times in this business when you suffer severe attacks of deja vu...haven't I already said "Mandelson
Resigns!"...I'm afraid I have, and tonight I shall say it again. He's gone, the fat lady has not only sung but
died completely and utterly on his career...that is the end of the former Northern Ireland Secretary's political career.

It's a body blow against Blair for whom Mandelson was a mentor, manipulator, calculator, friend, brother and the
third leg of his political footstool.
It's a body blow for a Prime Minister who has had to have him resign not once but twice. It calls into question
Tony Blair's judgement. Mandy, probably one of the most brilliant spirits in politics, flew too close to the
sun...suffering finally at the hand of his own diabolical flaw.
Amazingly it's a flaw Blair understood more keenly than anyone...

And then there are the Hindujas who have compromised every political party with ridiculous photographed party
poses..who are they and how do they work?
Masses moving on all fronts on this story tonight. We have the resignation speech in full on our site www.channel4.com/news;
if you want to see how Mandelson bowed out.

There are other developments:

The cancer tragedy at Nottingham Queens medical centre..the wrong drug going into the spinal column of an eighteen-year-old
Leukemia victim who's now in intensive care, dangerously ill...it's happened before..why has it happened again?

And a moving interview with Sharon Sage who's mother Lorna Sage wrote a spell binding memoir highly rated in last night's
Whitbread Prize. An exceptional piece....

A highly political night....see you at seven on four...best, as ever, Jon

After this email I unsubscribed from SnowMail. I could not be sure that these items were or were not about me,
but it's an unpleasant feeling that Mr Snow might be getting at me in writing, as he certainly was when he watched
me while presenting the news; so I cut my losses, so to speak, and bailed out.

BBC-TV "See You, See Me" - 7/Dec/2001

Certainty level: 80%

On Friday 7 December 2001, BBC Schools aired a TV programme from their "See You, See Me" series.
The series was based in Scotland, with Grant Stott and Wilma Kennedy trying to find some stolen jewels.
Its web home is www.bbc.co.uk/scotland/education/seeyouseeme/

The programme appeared to make some "subtext" references to my situation. Kennedy refers to "it's not fair",
which is a key phrase; its existence started with OCTS MD Hugh S.-W. who humorously referred to my treatment
with the same phrase.
The subtle statement is that it is fair, because we're doing it, and we're always right, even when we're wrong.

The phrase "useless idiot" from the police chief is a clear insult directed at me, and needs no explanation.

But it is the third item in this clip which is most telling. Stott says the words, "humiliating in front of
the whole public, it would crucify us" if the investigation were called off. That's the phrase that assures
this clip of an 80% probability rating. MI5 are trying to humiliate me "in front of the whole public",
and their strategy is a mixture of ambiguous covert, such as this very programme, and clear overt.

Channel Four TV News - 10/April/2002

Certainty level: 80%

I was watching Jon Snow on Channel Four TV News on Wednesday 10 April, and he again reacted on seeing me
watching his programme. At 7.25pm he was reading an item on atrocities during the Balkan war;

JS: "It was Europe's worst massacre since the Second World War, and Dutch army officers [cough] and the
United Nations should share the blame. So says the first authoritative report into the murder of
thousands of Muslim men in Srebrenice at the height of the Bosnian war in 1995. The 7,500 page document
took Dutch Government researchers six years to prepare, and it condemns military and political leaders
for sending peacekeepers on a mission impossible. Our Foreign Affairs correspondent Gaby Rado,
who went to Srebrenice very soon after the massacre, is with us now. Gaby, how damning is this report?"

GR: "Well it is very severe. It accuses the Dutch Government of sending badly armed and badly briefed
Dutch soldiers into a very dangerous space out of a sense of national arrogance basically. It accuses
the United Nations basically of..."

There are two incidents in this one recording. The first (80% certainty) is when Jon Snow develops a frog in
his throat in the first sentence, shortly after reading the text "Europe's worst massacre". There is both
verbal expression and facial expression at that point; he is laughing at me, which is at odds with the serious
material he is reading. His eyebrows twitch upwards, and he is smirking at the phrase "Europe's worst massacre", and its application to the Security Service's actions against me. Another aspect
is that when Snow said "Europe's worst massacre", I facially reacted; in return, Snow would have seen
my change of expression, and followed it with his own reaction. He almost says "United States" instead of
"United Nations"; he isn't looking at his autocue, his mind is off what he is reading, instead he is looking
at me in the little monitor where he sees me through the television.

The first incident I'm fairly sure about, but the second I only give a 20% certainty to; it's when Gaby Rado
talks of a "sense of national arrogance", supposedly about the Dutch, but perhaps the English actions
against me for over a decade. If Rado's statement were about me, then it would be condemnatory of MI5
as being "arrogant"; but I cannot be reasonably certain it's about me, or much less so that Snow's
reaction in the first instance, anyway.

There was a time once....

I used to have an FT-221 tricked out with a hot front end. Solar noise
would run the S meter up to well over the S9 mark and you could even see
the galactic plane passing through the antenna pattern. Needless to say,
it heard well on terrestrial 2m SSB.

BBC1 TV News - 18/Dec/2002

Certainty level: 30%

This item occurred on Wednesday 18/December/2002, on BBC1 TV News shortly after 6pm. It is one of the "coincidence"
category of happenings, where people by supposed coincidence repeat exactly the words I have said or thought very recently.
In this case, the BBC's New York correspondent Stephen Evans, live from NYC, says the words "airy fairy language",
during a piece on Britain's entry in the competition for a successor to the WTC after 9/11.

I had been thinking the words "airy fairy" a day or two previously and may have spoken them in my sleep. I did not speak them awake.
The TV practice in 1990-92 had been to repeat on TV/radio (or at work) words which I had either spoken while awake, or words I had
thought but not said consciously - since I know that I sometimes say things in my sleep, but cannot later recall saying them,
obviously since I was unconscious at the time. The TV news reader or reporter then finds a context in which to drop a particular phrase;
this practice has a famous exemplar in the "Phil the Greek" item relating to the Duke of Edinburgh - who had been called Phil the Greek
in Private Eye, then a TV reporter managed to structure his report to include the words "fill the Greek community with alarm".
It might appear funny, but when such "intentional coincidence" happens a lot, as in 1990-92, and when it supports other methods of obscenity,
then the amusement value wanes.

The choice of words appears to form a homosexual reference - the way it works is that the Security Service are blokes fantasising continually
about another bloke, so to avert the obvious observation of their being gay
see here for another instance of unwholesome MI5 fantasising in public),
they try to assign the attribute to the victim - they do this sort of thing all the time, with all sorts of attributes. However, in this
particular case I give it only a one in three probability, since this incident seems to have been a one-off at that particular time.

Life is so hard

Certainty level: 100%

This relates to harassment at my workplace in Canada. Yes, "they" had
their claws into my employers in North America, it doesn't just happen
in England, it happens here as well.

During the second half of 1996, at work, I was sitting near a co-worker
whom we shall call Mark (we can, because that's his name). This guy
occasionally came out with words and phrases that made me think that
"they" had got to him and were supplying him with information about my
home life (not social life please note, because of course I don't actually
have a social life here).

During November 1996 I tried to catch him in the act of saying something
"meaningful", a difficult exercise because as soon as he saw a tape
recorder, he shut up completely, except for times when he knew he would
be out of range of the walkman. (Note that the quality of this recording
is not very good; I was just using a four-year-old tape walkman with
a cheap microphone, quite low-tech).

During the evening of 12 November 1996, at home in my apartment (flat to
you UK-ers), I said "life is so hard, and then you die". A nihilistic,
negative thing to say, but quite distinctive. The following day,
13 November, Mark said loudly, "life is so hard eh, and then you die"
followed by loud laughter.

In my book the precise repetition of the words makes this incident a
100% certainty. You, the reader, may differ, but then living in a free
country allows each of us to have our own opinions, doesn't it?

Cross-posted to: rec.bicycles.rides,rec.outdoors.rv-travel,microsoft.public.es.win2000,alt.tv.reality,rec.radio.amateur.antenna

GLR-David Hepworth (21/Feb/1997)

Certainty level: 80%

I was listening to BBC Greater London Radio (GLR) by stealth, ie. on my walkman with headphones, with the sound turned right down, to prevent anyone from hearing what I was listening to. Yet somehow "they" are still able to tell what station I am listening to on the walkman. After half an hour or so listening to GLR, DJ David Hepworth came out with this;

"I assume Brian, do we have an embarrassment of prizes in there, we do, don't we, absolute obscene amounts of prizes, there will no doubt be a riot at the back door, and that's A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasised verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasised) described the disgusting sexual abuse which the harassers have been throwing at me.

Of course, I can't prove that this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. I sent David Hepworth a copy of this explanation, with the results listed in a subsequent item (David Hepworth 9/May/1997).

GLR-David Hepworth (9/May/1997)

Certainty level: 100%

This time I deliberately listened to Hepworth with the sound turned up on the radio, to try to get a reaction. Sure enough, he and his cronies reacted;

David: "we have executive drivetime, and we have Brian in charge of the prize cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David in fact it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know if you remember him obviously still alive and kicking.... and that's just in my left hand"

David: "So it's certainly worth competing. Rock and roll spelling test is your first opportunity to take advantage of this embarrassment of prizes"

What I "read into" this item should again be quite obvious. Remember, I sent off a letter of complaint to Hepworth after his spying activity during the previous show. Here the emphasis on "absolute embarrassment" of prizes shows he knows this is a "key" phrase.

It might be interesting to try to talk to DJs like Hepworth and ask them what they get out of abusing their listeners. But if you challenge them directly, they show their true colour (yellow) by either not answering the challenge, or by denying that harassment has taken place.

Neil Fox's Juke Box on Capital Radio (week ending 15/March/1998)

Certainty level: 70%

Here is an excerpt from Neil Fox's show on Capital Radio 95.8FM, sometime during the week ending Sunday 15/March/1998 (probably during the weekend, but I don't remember).

First I will give the text of the conversation between Neil Fox and telephone caller Martin, then I will state my interpretation.

(conversation) (F=Dr Fox, M=Martin the caller)

F: coming up on the jukebox, the hotline's 0171-4848-958, just a quick shout here and so who's this going to be then Mr Producer?
(staff, shouting) MARTIN!
F: Couldn't quite hear you, it's going to be?
(staff, normal voice) Martin.
F: Thank you. Martin, hello.
M: Hello, Foxy.
F: How are you Martin.
M: Er, knackered.
F: Why?
M: Didn't get much sleep last night. Party down the road.
F: What time did you go to bed?
M: Four o'clock this morning.
F: Well that sounds quite a reasonable Saturday night if you ask me.
M: I was up at eight.
F: You were up at eight this morning?
M: Yeah.
F: That's sick. Why? What on earth made you get out of bed at eight this morning?
M: My father.
F: Well that's no good. Why is he being sicko, is he being a sadist?
M: No, he out there, sort of clearing room.
F: Listen, is your dad there?
M: No, he's downstairs.
F: Oh mate, can you get him?
M: No.
F: Does he not let you on the phone? The only reason is that I wouldn't mind having a chat with someone who makes anyone get up at eight o'clock on a Sunday morning. I'm sorry, that's ill isn't it, that's out of order.
M: It's sick.
F: I'm just going to ask around here. What do you think then, eight o'clock Sunday morning? That's out of order isn't it, for any father?

(staff) Yeah, definitely.
F: Is he like victimising you or something, is there any reason why he wanted you up at eight o'clock? To clean your room?
M: Well as I say I got up at eight this morning to clean my room and it looks worse that it did yesterday.
F: Well I should have just left it and stayed in there until eleven o'clock if I was you.
M: Well I was up, I didn't get out of bed.
F: What, you didn't get out of bed at eight o'clock? No, he woke you up at eight o'clock. Did you do any cleaning at all?
M: I haven't touched my bedroom.
F: Top man. Boy you're going to get your arse kicked later aren't you. Now a song for you, what can we play?
M: Guns and Roses, "Sweet Child of Mine".
F: And we're going to dedicate this to your father?
M: No we're not, we'll dedicate this to my good mate Jamie, who's sitting on the bed now.
F: Right, hello Jamie. And anyone else? Any top totty in your life at the moment?
M: Unfortunately no.
F: The totty factor is quite low at the moment is it?
M: It's dead.
F: It's dead? What, nothing?
M: Nothing.
F: What, zero? Well, that's pathetic. No wonder you're down. You stay out til four o'clock and nothing. We'd better have words when we're off the radio I think. We need to give you a team talk. You have a good night tonight.
M: And you.
F: Take care.
(song starts)
F: Actually something was going through my mind. I think I'll leave it.

I'm not really sure whether this is in any way about me. It probably isn't. Probably it's just my nasty suspicious mind finding links where none exist. However, here is an explanation of why it might, possibly, be about me.

Throughout this interview, I was throwing abuse at the radio, and to my mind, Neil Fox was hearing the abuse, and responding interactively. This explains why he sounds so stressed when talking to telephone caller Martin, and the general violence of his words including "Boy you're going to get your arse kicked later aren't you".

The piece starts of with the producer shouting the name of the caller, which might be related to my loud vocalisations at the radio. The trouble starts off with Fox saying "That's sick". "Sick" might be taken as a reference to my condition. Then Fox says, "Why is he being sicko, is he being a sadist?", again sick = my illness, "sadist" = attitude of my oppressors towards me. "that's ill isn't it" = further comment on my illness. "Is he like victimising you or something" = again what my enemies are doing to me.

Fox sounds quite happy when he gets Martin to say "It's sick"; as you would expect him to, if the comment were directed at me. It is a constant feature of my enemies' harassment of me that they get intermediaries to verbalise the abuse. Immediately after saying "victimising you" Fox gives a little laugh, to show he thinks the victimisation (of me, not Martin) is funny.

Fox gets increasingly nasty as the piece progresses. "Boy you're going to get your arse kicked later aren't you" is not really what you would expect him to say if he were just talking to Martin. Fox is on the same side as Martin, so why would he be so verbally aggressive to him? On the other hand, if the piece is about me, then his strong words start to make sense.

Fox's jubilation at finding that Martin's "totty factor" is "dead" again doesn't make much sense unless you think that he might not be considering Martin's totty factor, but mine, since it's a fairly well known fact that my "totty factor" is not significantly above zero.

To round off the 135 second interchange, just as the next track is starting, Fox says, "Actually something was going through my mind. I think I'll leave it". Given that I was chucking abuse at Fox throughout, it is only natural for him have thought up a reply that he would have wished to have made, except that such a reply would (a) probably not be suitable for a family show, and (b) have given the game away completely.

So there you are. You the jury, what say you in the case of plaintiff vs. Neil Fox's Juke Box, guilty or not guilty?

Foxy's Showtime on Capital FM 25/11/98 7.35pm

Certainty level: 100%

This one, I can say with absolute certainty, is about me. It was recorded on my Sony Recording Walkman on the evening of Wednesday 25 November 1998. It doesn't mention me by name, so the objective observer might have trouble understanding why I'm so sure it's about me. I'm sure, because the harassment had restarted over the period when this piece was broadcast, and what Capital transmitted would have been in context with events at the time. (Sorry if that explanation is somewhat opaque, but I don't really want to embarrass myself by giving an explanation in detail, and an intelligent reader should be able to work it out for him/her self.)

This isn't the first time Capital have "got at" me; they were doing so right at the very beginning in summer 1990, when they said, "if he listens to Capital then he can't be all bad"; and Tarrant made remarks about me in his breakfast show in spring 1994, when he said, "you know this bloke? he says we're trying to kill him. We should be done for attempted manslaughter."

Unfortunately I didn't record those previous, much more conclusive instances of harassment by Capital DJs, and Capital Radio tells me they only keep recordings for three months. But lately I've been recording everything, and here is one product of that recording.

Neil Fox was introducing some petite Swedish songstress, sounded like Amelia, when he said something about her petite-ness ;

"she's a big big girl, actually she's really about tiny, she's this big, would you say what less than....."

then one of his studio staff shouted, "six inches"

then Fox laughed and said, "less than a meter tall, definitely"

What I think the "six inches" referred to should be obvious. I think it's sexual abuse directed at me.

Also there were a lot of words like "crazy", "mad" etc on this programme, which reinforced my belief that this was on purpose directed at myself.

I think Fox may be something of an unwilling participant in this abuse, he doesn't want to be an abuser but the persecutors are using his show and his staff to get at me. This is not the first time this sort of thing has happened from his show; and my guess is that it won't be the last

FYI, I checked the MFJ-269 manual, and it claims: "a relatively pure
(harmonics better than -25dBc) signal of approximately 3 Vpp
(aproximately 20 milliwatts) into 50 ohms."

So my measurement of 3 milliwatts on the wattmeter could have been
low.

The only way to coil up 450 ohm line is to keep all
parts of each coil at least 3-4 inches from all other
coils. A spiral will work but you certainly *cannot*
successfully coil up balanced ladder-line as you
can with unbalanced coax.

During the 1960's I engineered the antenna systems that flew on the early TIROS weather satellites. The
antennas radiated both RHCP and LHCP. In the earthward direction the gain was approximately 3 dBi. At the
ground station I operated the antenna had a 16 dBd gain at the beacon frequency of 136 MHz The beacon xmtrs
output power was 5 mW. While the satellite was at maximum slant range (just over the horizon) of 1800 miles,
the signal level from the beacons was several dB over S9 on R-390 receivers with their associated frequency
down converters.

That is no mean feat!

I think ambient noise temperature at 144MHz for an antenna pointed at cold sky is somewhere around 200K to 250K, when you add a pretty good receiver at say 30K, you are talking 230K to 280K total system noise, and the sun is probably around 800K with a low end 4 bay EME antenna setup (Gain~22dBi), for a noise rise of 10*log((800+255)/255) or 16dB.

A single yagi of gain around 15dBi is much poorer, not only is the sun noise reduced proportionately to the gain reduction, but the ambient noise increases with higher gain in the side and back area of the antenna, but it still should be possible to reliably 'see' the sun with a very good receiver.

Ambient noise temperature for a beam at zero elevation here in suburbia varies from 1000K to 6000K depending on the day and time... so a very low temperature receiver is wasted for terrestrial contacts.

You better believe no mean feat! I worked off the moon on 432 MHz back in the late 70's. Sixteen 16 element Yagis (calculated gain ~26 dB) and an STA from the FCC to use 5 KW as long as the antennas were pointed above 25 degrees elevation. (Protecting Eglin radars some 200 plus miles away.)

I could consistently manage some 4, 4-1/2 dB of sun noise off a quiet sun and not one smidge more even with a mast mounted GaAs Fet preamp supposedly with some 0.8 dB NF.

I DID however, at around the same time, own a 2 meter Jap all-mode transceiver that I happened to measure the "S" meter accuracy with an HP signal generator. It turned out that 2 uVolts was "S"-1. THREE uVolts was "S"-9.

==========
Is it correct that for frequencies up to 30 MHz a S9 signal is 50
microvolt into 50 Ohms (or -73 dBm) but that for higher frequencies a
S9 signal is 5 microvolts into 50 ohms (or -93 dBm).
If that is (the agreed) norm ,was it ever formally sanctioned by IARU ?

I can hardly believe that any of the far eastern rice boxes have a
properly calibrated S-meter. Also the top end of the S-meter scale is
usually rather 'compressed', which surprises me since ICs with a log
type input/output relationship must be readily available.

Time to attempt calibrating the S-meter of my (almost vintage) TenTec
Paragon TRX.

I've never heard of a convention like that. Can't imagine a reason to make
it different for HF and VHF.

They are now. (AD 600, 603 and MOT chips with RSSI etc.) VERY expensive
compared to a couple of 2N2222 type IF transistors and mass production will
go to the ends of the earth to save a couple pennies.

If I had a Paragon, I'd try very hard to get rid of it. The worst radio Ten
Rec ever made (And the only up conversion one I remember) WRT LO phase
noise. Horrible on of course, both RX and TX. I had to put up with a
neighbors for several years. (And he-me when he was receiving. My
transceiver improved a whole lot when he bought a new radio.)

Frank, leaving aside your apparent prejudice about the country of origin
of a radio...

It seems that IARU Region 1 Technical Recommendation 1 lays down the
Region 1 view of S meter equivalence in power, but that does not seem to
have wider acceptance more than 25 years later.

Talking about SSB telephony receivers...

The next problem that occurs is that many radios are loosely calibrated
with the selectable internal preamp OFF, a good idea for lower HF bands,
but questionable on VHF and above. The user manuals don't often state the
correct configuration for calibrated S meter response. Apparently, the
technology hasn't advanced enough to have the S meter calibrated whether
or not the internal preamp on in use.

(It is quite possible that the example that Harold gave is one of those
radios that is calibrated with internal preamp OFF and he measured it
with preamp ON.)

The radio's S meter may often be fairly roughly calibrated between about S6 and S9+20 (with the preamp OFF if that is the case for the particular radio), but is unlikely to be very accurate below and above that range.

Considering the design of a transceiver, if the S meter is calibrated with preamp OFF, the receiver could have a noise figure around 15dB, which means its noise floor is around -126dBm. Typically, the AGC is deferred until the signal reaches about 20dB above the noise floor, so that would be -106dBm+ which is about S3 and a half+. So the AGC will not operate, and the S meter not deflect until the signal is above S3+, yet the meters will typically be scaled from S0 or S1.

Next, these radios may be used with an external preamp, or a transverter, both with substantial gain. So, a transceiver that is roughly calibrated with the preamp OFF, is used with preamp ON for another 20dB or so of gain, then an external 25dB preamp offset by a few dB of line loss, so the S meter is now reading some 35dB high. The increased gain is usually much higher for a LAN-transverter-transceiver cascade.

In my experience, quantitative signal reports handed out on VHF and above are commonly nonsense, which is interesting given the greater focus on weak signal working and understanding path characteristics.

The other thing that contributes to this nonsense is that people cheating on power often give the other station the same report that they received to disguise the lack of symmetry due to their own excessive tx power.

FM receiver S meter calibration is a whole 'nother thing. Lacking an AGC system, it is typically limiter current that is used to drive the S meter and it usually takes less than 10uV to drive them to full scale, S9 might be indicated by just a few uV. Mind you, a 5uV FM signal has very good S/N, but that doesn't make it a strong signal.

GM Owen

The transceiver I had back then didn't have a switcheable preamp. It was just always on. Don't even remember the mfg, but it was a little flat radio. 3 inches high (if that) and spread all over the desktop. The "S" meter was indeed driven from the limiters

Anyway, "S" meters that are inaccurate or change the value of the received signal when you turn a preamp on or off (Or an attenuator on or off) are an abomination. In this day and age of microprocessors, it's childs play to adjust the "S" meter to accomodate those changes. (Take a look at the "PicaStar" which does exactly that. It also yields 6 dB per "S" unit and 10 dB for every 10 dB over "S" 9 as well. Makes the radio into virtually a piece of lab test equipment. Short of that use, the "S" meter report IS rather rediculous. (You're 5-9, what was the call and name again?)

Wrong way around: those standards (along with 6dB per S-point) were
formally sanctioned by IARU, but almost no amateur receiver has ever met
those standards.

>I can hardly believe that any of the far eastern rice boxes have a
>properly calibrated S-meter. Also the top end of the S-meter scale is
>usually rather 'compressed', which surprises me since ICs with a log
>type input/output relationship must be readily available.

Conventional S-meters don't actually measure signal strength - they
measure the AGC voltage. The S-meter could only be accurate if the
voltage/gain characteristic of the AGC-controlled stages happened to be
accurately logarithmic across the entire dynamic range of the receiver;
which is almost never true.

An accurate S-meter will also need some compensation for variations in
gain across the HF bands. Above all, a true reading of 'signal strength'
should NOT change when you switch in a preamp or an attenuator, or vary
the RF gain.

For the long story, see 'S Meter Blues' by W8WWV:

I would like to see what mods are made to the 221 to do that and also what kind of antenna system. I have a 221 I am using with a gasfet preamp in the shack that should be less than 1 db of noise fugure and about 20 db of gain. The antenna is a klm 22c and 75 feet of 9913 type of coax. I can just see some sun noise with the antenna aimed at the sun. It sure does not deflect the smeter several sunits. The antenna is on an azel mount. I am sure the system is working as I compaired it to an Icom 706 and another antenna that is mounted on a tower and I am getting about the differance in signal levels I would expect at the horizon.

Howard-

I don't think there is a 160 Meter Hustler resonator currently
available. I don't know if they ever made one, or made a single-band
160 Meter mobile antenna.

I have a 160 Meter mobile antenna purchased several years ago from AES.
As I recall, it was NOT made by Hustler. I can't find any markings on
it that might tell who made it.

It is in a similar configuration to the Hustler with a resonator, except
using a much shorter mast below the coil. I suspect it would hit
highway overpasses if the coil and top parts were used on a Hustler mast!

The 75 feet of coax is your problem!!! What is the point of a 1dB NF preamp
with all that loss ahead of it? To see the benefit of the low noise figure
the amp must be before all that cable loss!!

The coax only has a loss of 1 db for the length I am running it. I doubt
that at 2 meters I would see any benift of putting the preamp at the
antenna. It is as easy to get a 1 db or less noise figure at 2 meters as it
is to make any preamp and the 221 does need some help on the receiving side.
From the articals I have read the beam width of most any single antennas at
2 meters is wide enough the ground noise will override that ammount of loss.

Agreed. Your 1 dB preamp just became a 2 dB preamp and the visible ground temperature likely overrode either figure and by a good margin. I suspect the original poster with his S9 sun noise and "seeing" the Galactic plane was being a bit optimistic.

Perhaps the answer here is to only use the analyzer on bands that are not in active use at the time, like say Noon on 75 meters. I'm speaking of when propogation is dead on thise bands because of time of day.

Would the legality of it change? Probably not, but by doing it that way you would have minimized the possibility of intererfering with any other users that could hear you.

I think 1dB is a little optimistic for 75' of 9913 coax, it is in reality, I
suspect, nearer 1.5dB.

Any loss ahead of your preamp adds directly to the noise figure of the
system so the best NF that you could ever have is 2.5dB plus a little form
the 221.
Also 20dB of gain in the preamp sounds like a sure way to produce intermods
in your radio.

Regards
Jeff

Well of course it is Jeff, but in moonbounce, noise figure is the holy grail. There weren't as many folks on 432 and moonbounce in particular back in 1979, but I NEVER was plagued with intermod off the moon, and the directivity of the array kept me from having any from anywhere else.

Hustler/Newtronics (http://www.new-tronics.com/) never made a resonator for 160m (I used to sell Hustler at the local ham radio emporium).
That said, there's no reason you can't modify the parts you *can* get and/or use an ATU with it. I've done just that with 80-10m parts & pieces. The whips are 0.1" diameter, and Larsen sells 49" and 64" tapered whips that are the same diameter at the bottom...

75m = 64" whip + reduce inductance on RM75
40m = 49" whip + reduce inductance on RM40
20m = 49" whip shortened to ~40" + RM15
I haven't yet tried anything special for 15m, but expect an RM10 or RM12 + longer whip will work.
10m = 49" whip + homebrew 3/8"-24 fem/1/4"-28 male adapter + ferrule & locknut (no loading coil)

Interesting numbers, Dave.

W8PIL and I published a paper in QST in the 60s that dealt with the noise into a receiver from extraterrestrial sources. For those numbers to be limiting, one needs to be well away from people and one needs an antenna that has a very large directivity. In the other hand, if your receiver is in space, its antenna is not pointed at earth, and you have an antenna with a moderate directivity, then the numbers we presented will limit SNR.

I was involved in the early measurements of the temperature of the moon with a two-frequency feed using an 85 foot dish. Two-frequency = resonate at two frequencies separated by 2 times the IF frequency so more "signal" could be acquired. VT front end using every scheme in the book. Today, with almost no design, an FET off-the-shelf would be much better.

What huge improvements I have seen in the NF of VHF and UHF amplifiers. However, the techniques for achieving low NF have not changed from the ideas contained in v18 of the MIT Radiation Lab series.

WESTERN CONNECTICUT HAMFEST
Sponsored by: Candlewood Amateur Radio Association - CARA

Sunday, September 16, 2007
Table Set-up at 7:00 AM.
Open to the public 8:30 AM to 12:30 PM

Edmond Town Hall, 45 Main St. (Route 25), Newtown, CT Exit 10 off of I-84

Admission $5.00, Kids Under 12 FREE.
Tables $12.50 Tailgating $8.00. (Both INCLUDE 1 admission).

ARRL Sanctioned. Talk-in on 147.300 (+) PL 100.0.

Seminars
- Mechanical TV – Those were the days
- Airmail – How it works, incl demo
- Satellite Communications – How to do it
- NVIS Antennas (courtesy of ARRL)Handicapped Access. Ham Radio Equipment.
Batteries for Emergency Comms. Computers. Door Prizes.
Refreshments. Ample Parking. Rain or shine.

Only 12 minutes from Brewster, NY, 15 minutes from Waterbury, CT.

For information
call: (203) 938 4880 or (203) 775 1946

So, lets take some guesses about things here. FT221 native NF ~8dB, line loss 0.2dB, preamp 1dB NF, 20dB gain, 9913 loss 1.2dB (75', load end VSWR 1.5). On my reckoning, Teq at antenna connector is 200K. The antenna is I understand a 22 element crossed Yagi, let's assign it 15dBi for the purposes of discussion.

Looking back at the earlier scenario, ambient (cold sky and earth) of 225K (ignoring the prospect of worse spillover with the smaller antenna) and sun noise of 160K, sun noise rise would be (225+200+160)/(225+200) or 1.4dB. That is not going to be very noticeable on an S meter.

O&OE!!!

At higher points in the solar cycle or if the sun is disturbed, the rise will be greater, but genuine quiet sun measurements should not capture disturbed sun, should they? Antennas more sensitive off the back / sides will be worse.

In that scenario, moving the preamp to the antenna would improve G/T from -11.3dB to -10.1, yielding a 1.2dB improvement in S/N ratio. At zero elevation, the ambient noise is typically much higher and the improvement would be much less.

Ambient noise is pretty easy to measure on 144MHz in a simple station. If you know the noise figure of your receiver and loss to the antenna, and providing ambient noise is not sufficient to cause AGC, note the audio power output change between antenna and a dummy load, you can calculate the ambient noise, see http://www.vk1od.net/sc/anc.htm for more information. In fact, with this tool, I can measure the change in audio output on my TS2000 by switching the internal 12.1dB attenuator in, and calculate Ta (try Example 3).

I hear sun noise rise bragged about, but the bragger often cannot quote the solar flux prevailing at the time, in which case it is rather meaningless, especially when their method is to capture the largest rise rather than largest minimum rise whithout artificial compression.

The reason I wrote the online calculator is that a number of people I have discussed sun noise rise with were using solar flux figures that were old and / or the wrong frequency.

Is it?

Knowing G/T allows you to calculate the S/N ratio for a known incoming power flux density. Better, improvement in G/T ratio yields exactly the same improvement in S/N.

You cannot do that with NF alone, so it is not a single metric that characterises receive performance of a station.

Moonbouncers who focus on NF alone are as blinkered as anyone else who does that.

This was a VERY quiet location. The only VHF stuff around was a bit of
156mhz and 161mhz stuff on a tower about 5 miles away. I could JUST see
the big tower downtown that most of the FM broadcast stations used, but
it was about 12 miles away and partially obscured by trees and a hill.
But to the south and west was mostly ocean. VERY quiet VHF location. One
time I worked a guy in a plane flying from St. Johns, Newfoundland to
Montreal, on 146.49 simplex FM. He just had a handheld in the cockpit
window and we stayed in contact (from my suburban Halifax location) from
the time he reached cruising altitude (30-some thousand) until he began
his descent into Montreal. The distance at the end of the QSO was
approaching 800 miles.

I did not notice any particular propagation that day, this was just plain
simplex FM. Now I was running about 600 watts at my end of the pipe, but
I could hear his handheld just fine.

Near as I could measure it, the NF of the receiver after my mod was
1.2db. I had to resort to boiling and freezing water and a tiny dummy
load to measure it at all.

Yeah, and that just gets worse when you put a decent preamp in front of
it.

Well, the sun is much quieter nowadays than it was back then. When I had the station at its peak, I was running a single 19-element boomer at 85 feet, with boudle shielded Belden COAX. The preamp I was using was a mosfet, which, to the best of my measurement ability (none of the signal generators at work could come close to measuring it) gave it a 1.2db noise figure. Now there was probably also a 6db ground reflection gain from measuring the solar noise at the horizon (sunset or sunrise) and, as I say, it was a period when solar activity was high (6 meters was open to Mexico city a lot).

Yep...when I moved, I put in hardline and lowered the antenna a bunch.

That's when I started to hear other things besides the sun. And I could
plot it. When the galactic plane was in front of the antenna, the noise
floor would be up an S-unit from base.

Out of the box, the 221 had a noise figure somewhat north of 12db. I've
seen vacuum tube radios that were not much worse.

I haven't tried hot/cold tests using ice and boiling water, I didn't think it was practical.

You finally measured a receiver noise temperature of 50K with hot and cold loads of 270 and 370.

That means a Y factor of 1.059dB.

If Y were just 0.1dB greater, NF would be 0.78dB, 0.1dB lower and, NF would be 1.66dB.

With this configuration the sensitivity of NF to changes in Y are extreme, 0.4dB change in NF per 0.1dB change in Y around that point.

If you made the Y measurements using the audio output of a narrow band receiver, it is very hard to make high resolution measurements (eg to 0.01dB resolution) with say, a multimeter.

I have done these tests with a liquid nitrogen cooled load and room temperature load, and that gives more practical Y ratios, 3.7dB for a 1.2dBNF, and the sensitivity in NF is 0.08dB per 0.1dB change in Y. This still demands high resolution measurement of noise power.

Whilst OFDM is the modulation scheme most commonly used to try to work in the hostile environment that BPL must, it isn't magic, it might have many advantages in such an environment, but you still need to acheive S/N ratio over a substantial bandwidth to obtain the required speed to make it economical.

BPL transceivers work in a high noise environment, the power lines are polluted with noise that is to some extent limited by existing EMC standards. (In most jurisdictions, BPL modems must comply with existing EMC standards. Interestingly, one of our local test houses convinced themselves that BPL modems could be tested for EMC compliance with the carriers disables... but they didn't convince the regulator!)

The challenge for BPL developers is to achieve adequate S/N to meet their speed requirements in a noisy environment when their power levels are effectively limited by the same emission standards as the other polluters (eg plasma TVs). Essentially, they are not assured of adequate headroom to work properly now or in the future. An issue they must want to address.

There is no comfort for radio users in that challenge, because the current standards limiting emission are not designed to prevent interference, merely to reduce the risk of interference. If every metre of powerline radiated at the permitted limit for EMC, you can forget about ham radio as you knew it.

Owen

I would be highly surprised if BPL ever becomes much more than a pawn in an attempt to keep major telcos/isps in check and an easy method to get the net in remote areas.

That said, 2+ million homes in the USA isn't really totally insignificant. I hold hope for the new 700 Mhz freqs being made free to all uses/devices/internet-suppliers ... this is where joe-blow-internet-user really will reap benefits.

However, there is always that unknown wild card which can change the whole game and at any moment, coming out of left field and in the blink of an eye!

Regards,
JS

POTS lines are encoded at 64 Kbps, which is why V.90 modems work, and
which is sufficient for decent audio, albeit not "hi-fi".

From: "J. Mc Laughlin" <jcm@power-net.net>
Message-ID: <7dSdnV8ropJY2E_bnZ2dnUVZ_g2dnZ2d@bright.net>
Source record: 36931

Dear Owen:
Others too may remember the use of a noise source comprising a gas tube crossways in a piece of waveguide (with 50 ohm probes) to estimate noise figure in the VT days. One would fire the gas tube and it was estimated to have a very large, "known" noise temp. Boiling water, while a known temp., would not have been hot enough.

Ice water was critical in the use of the HILLMS receiver used to measure absolute flux. The antenna was a very long horn antenna resting on the side of a deep gully. In those days, a horn antenna was one of the few antennas with a predictable gain. The receiver switched at a low frequency between the antenna and a load kept in ice water. The gain of the receiver was stabilized with a huge amount of negative feedback. Once a day, the source would pass through the antenna's beam and a strip chart recorder would indicate the difference between ice water and the source's temp.

Today, with much lower NF, and much more EM pollution, different techniques might be used.

POTS lines are not encoded at all. Hence "Plain Old Telephone Service" which
can be used with any telephone (ain't no decoders in a WE 500 deskset) that
uses a DC line.

In the US, the telephone network has been digital since 1962. At the time of the conversion, there was a decision made to keep the instrument and the interface familiar to the user, so there is no conversion in the deskset, and the 'last mile' from the CO is still analogue with battery voltage as it always has been. But behind that interface, the network is digital.

Now, that 'last mile' analogue circuit can be VERY poor. In my area, a v.92 modem will only pass 14.4. While only a mile up the road, I was getting 53k+ on the same v.92 modem.

When the network was converted from analogue to digital, there were complaints that voices no longer sounded right and that some people didn't sound like themselves. The complaints reached suce a pitch that AT&T launched a PR campaign in which TV spots attempted to explain the change in the audio at the instrument. As was the style of the times, they didn't really explain anything, certainly nothing as technical as digital audio, but instead, they described, through narrative and animation, how a person speaking into a telephone would connect to the central hub, where a voice that was similar to the speaker's voice was selected, and sent on to the far end. That's why someone didn't sound like themeselves.

No one bought it, of course, what with AT&T's reputation, by that point...but it was a hilarious exercise in TelCo spin.

And paved the way for the explanation of 'Tru-Voice' 30 years later.

Yes, POTS lines are encoded. At the CO. The only thing POTS about a
POTS line is what sits on your desk, and a length of copper to the network.

POTS lines that are on pair gain systems are, indeed, coded in the same
manner as is the message network. It has nothing to do with the phone, and
is transparent to the user. They may, however, not be coded to a full 64
kbit/s.

What one be the input impedance of a 10ft loaded mobile antenna on 160M?!.
Gotta be less than 1 ohm.

Jimmie

> W4ZCB

Well that's the first FT221 I heard of working on 432MHz!! If you are talking about that band rather than 144MHz then the cable loss would have been far higher and the NF of the system much higher.

Having a preamp with a gain of 20dB right in front of the radio is just plain silly. Pre-amp gains should be kept as low as possible. They should have just sufficient gain so that their low noise figure defines the system noise figure. Any excess gain is wasted and just asking for large signal problems.

If NF was such a Holy Grail then why throw away a significant improvement by putting the preamp after the feeder any degrading the system NF by the feeder loss?

Jeff

I have never seen an FT221 with a NF anywhere near that. They normally cone in at about 5-6dB as standard and about 1.5 with the Mutek front-end board fitted.

I'd agree with 5-6dB as much more typical, but more like 2-2.5dB when the muTek board is simply plugged in. Another 0.5dB can be gained by avoiding the card edge connector, and installing a direct coax link from the antenna relay onto the board.

As the person who designed the original FT221 board (which Chris Bartram at muTek re-engineered for production) I wore out two dial drives chasing 2m DX with that rig! But in all that time, I never saw S9 sun noise. The only time I've seen anything approaching that level, it has been from a major solar flare.

The input impedance cannot be less than the ground
losses which are usually in the ballpark of 10 ohms.
My ARRL Antenna Book estimates the feedpoint
impedance at ~34 ohms with a radiation resistance
of ~0.2 ohms for an efficiency of ~0.6% using a
coil with a Q of 300 which is no doubt higher than
any Hustler coil. I hope John Doe likes 160m QRP -
100 watts in with less than 1/2 watt radiated.

2 items

1] I have since found that Hustler did not make a 160m coil, but Pro-Am/Valor makes this item (VAL PHF160 = VALOR 160M 8' 3/8-24 WHP/PHF 160B) that I might be able to substitute in its stead.

2] I live in a Antenna restricted community, and I have a 40ft pine tree in my back yard. I thought that I might try the above mentioned item in conjunction with lets say a "LDG AT-200 Pro" auto-tuner or equivalent. (Note - I cannot run any wires from the house to the tree in the air - they have to be buried. Also I do not have any fencing and my rain gutters are grounded.)

My idea is to strap either a metal or pvc painted pole near the top of the tree, with a mount bracket for the whip (of course all painted to look like the tree). I will have to feed it with RG-8x (painted) run down the tree and buried in a trench to the house.

As far as radials go - They are out of the question. Instead - what do you think if I should just roll up say 250ft of 13ga or so of single conductor wire about a foot in diameter, attached at the base of the mounting bracket (hung in the tree) and use it as a counterpoise? I might be able to hang in the lower branches of the tree - a waterproof box with a loading coil and attach the counterpoise there instead?

If I could tune TX/RX with this configuration, then I could possibly use it to cover all of the HF bands.

Of course, I would like to work DX, but if not possible, then at least conus.

Comments welcomed.

If you just want to have 160 on the 80-10m base antenna then just add about
8ft of wire to the whip just above the coil. It ends up with about 40k
bandwidth. You lose 80 though.
I tried a mobile coil from a Proam whip to replace the 80m coil but it was
only 10k wide!!!! So I did the above.

I think you are talking about bobile antenna anyway so you could use another
make of coil as the threads semm to be all the same. but it is gojng to be
sharp!!
Cheers Dave

> in my back yard.

Now you are getting somewhere. Run a 40 foot vertical wire
up the tree and use some of the upper limbs for a top hat
made out of small wires. Feed it at the base of the tree
with an autotuner. A 40 foot vertical will radiate ten
times as much RF on 160m as will a 10 foot vertical.
The addition of top hat wires can double that figure.
You may get such an antenna to be 10% efficient.

> As far as radials go - They are out of the question.

At the autotuner, you need a counterpoise of some kind
unless you live in a salt water swamp. If you can bury
coax, can you also bury a 100 foot counterpoise? Note
that the ground causes the counterpoise to have a low
velocity factor so 1/4WL of wire is not necessary.

Maybe thats why Hustler never marketed such a coil.

Instead of BPL ,would it not be viable for power companies to run fibre
along overhead power wires and provide true HS broadband
this way .
Fibre is non-conductive and hence appropriate in a HV environment.

I think I remember a test conducted to see how much power it would take to communicate across the United States coast to coast. They started out making the contact at near legal limit and were still able to detect the signal at just a few milliwatts. As I remember a few was less than 10. I am sure this was part of a ham magazine article from many years ago. perhaps someone else here knows the details better than I.

It is my understanding, only the last short distance to your home is copper, the rest is fiber. The generous telcos did this SO THAT YOU COULD KEEP THE PHONE YOU ARE USED TO (or this is the reason given by telcos, who limit bandwidth by such), except for small copper run, these lines are already fiber.

Too explain the above better:

When the telcos were faced with implementing the new fiber lines, from central offices outward, they decided to keep the very end tails of these runs copper. Their argument was based on the stated reason that they wanted to keep the end users phones of a design with which the public was familiar with (awww, they were thinking of us, NOT money! :-))--something I NEVER believed to this very day. But, though sheer coincidence, just happened to benefit the phone companies enormously.

BPL is here to stay--whether you like it or NOT and in one form or another. Manipulations far from our sight will drive this. An informed public might help, getting that informed public might take awhile. :-(

Don't forget that the rise of QRP activity forty years ago came due
to the realization that you didn't always need high power.

ANd one subset of QRP is to try to communicate with as little power
as possible. Sometimes that was deliberate, dropping power until
the signal was no longer receivable at theother end.

It seems to me, many here have suggested there are "tons" of active hams out there; some have even went so far as to claim the bands are "crowded."

Surely, taking in to account the above, the few brief milliwatts from an analyzer are of no real consequence amongst this "rf pollution" ... and ten milliwatts would never make it across such a country of such active hams.

Indeed, this would be a very challenging measurement, because you also
have to take into account the match of that load, and if it's just a
resistor that you're plunging into hot and cold, its resistance will
almost certainly change. At microwave frequencies, a more common
technique for radiometers is to use a flat plate absorber that has been
characterized for changes in absorption over temperature.

One might want to take a look at how NIST does this kind of thing.
Here's the slides from a talk by Jim Randa
http://www.boulder.nist.gov/div818/81801/Noise/Talks/Noise%20Shrt%20Crs_06.pdf

he's a noise measurement guru at NIST.. check out the website:

http://www.boulder.nist.gov/div818/81801/Noise/

I've had a precision noise source (used to do Y factor measurements on a precision 13.402 GHz receiver) measured in their lab over a week. The measurement uncertainty (for a system with waveguide connections) was in the few Kelvins range (out of a noise power of 7000K or so), and the connect/reconnect uncertainty dominates. I doubt one could get this kind of performance with a coaxial connector (the uncertainty in the mismatch).

By the way, a good noise diode source is probably a better standard for the hot side than heating a resistor. They're very, very stable over time, once calibrated, and if properly designed, have a very stable match as the noise is turned on and off. (that's what we were using in the above system, a temperature controlled Noise/Com style source).

http://www.boulder.nist.gov/div818/81801/Noise/publications/01_Stability_IM.pdf
http://www.boulder.nist.gov/div818/81801/Noise/publications/00_Stability_CPEM.pdf

describes the performance

Another useful link might be:
http://www.boulder.nist.gov/div818/81801/Noise/publications/97_Amps_IM.pdf
D.F. Wait, J. Randa, "Amplifier Noise Measurements at NIST", IEEE Trans on Inst. and Meas., v.46, n.2, Apr 1997

They give measurement uncertainties of 0.04dB on a 0.5 dB NF for 2-4 GHz..

Not only that, but they already charge you a tax to support their
their (supposedly) money loosing operations in sparsely populated
areas.

IMHO the real answers to BPL are to run fiber along the electric
right of way (which was done here), or to set up a WiMax MESH network
on power poles.

According to

http://www.wimax.com/education/faq/faq31

average network range would be 4-5 miles. More than enough for most places.
How many people are more than 4 miles from a power pole?

Performance would be good, but latency would be high, which precludes
VoIP, and real time video. It does work fine for web surfing, email
and background delivery of video programs (Democracy player type
systems instead of Joost).

Geoff.

Jim, an important point, and more generally on the mismatch issue...

It seems that many measuring sun noise rise prefer to measure the rise by attenuator substitution.

Though it seems a simple and sound method of measurement, the effects of mismatch need to be considered, not only on the power delivered to the receiver chain, but also the noise figure of the device with the changing input or output loads. The effects are not necessarily easy to quantify, which makes the apparently simple method a bit of a trap.

I suppose a whole new communication/distribution system, relays, inline amps, etc., along with a whole new infrastructure to maintain and support the mess ... speaking about the USA--of course.

Frankly, the telcos, supposedly, have hardened/semi-hardened system to survive some level of EMP attack, and a complete communications system already in effect, maintaining lines is already done, etc., etc. ... it would be cheaper to just bring it out of the stone age and upgrade it to a user friendly level.

But hey, a whole other system would be great, if you don't mind the extravagant cost of such ... I am of the opinion that the internet should be like the public water system--available to everyone at a cost which even the impoverished can afford--easily.

Hi All,

Given the notoriety that follows discussion about the Real component
of the transmitter's source Z....

Let's see, How do I measure thee, let me count the ways. Anyone want
to venture a guess on the value of the Real component of the receivers
load Z? (And then we game this into the S-9 50ï¿½V across those myriad
resistors.)

Only just and you need a good 4-digit or better AC voltmeter to do it at
all. I wasn't after accuracy, just a ball-park estimate and I know I got
it fairly close because the receiver did show a marked increase in noise
when any decent antenna was connected.

Yep...the most I'd be willing to commit to with that measurement would be
that it was below around 2.5 and PROBABLY fairly close to my measurement.
I measured the voltages alternately 25 times and took a mean to try to
smooth out the errors.

It is. You need a good AC voltmeter with decent digital accuracy and
resolution and you have to average a bunch of readings.

Yes, anything less than 4 digits is just about useless.

I put some notes together on a perspective of the noise measurement
(sampling) process and its statistical uncertainty, they are at
http://www.vk1od.net/fsm/nmu.htm .

It is my experience that a digital voltmeter probably samples for
something around 100ms, and with a 2kHz wide noise bandwidth, you might
expect an uncertainty of near 0.5dB at the 90% confidence level. Just
watch the readings bounce around.

Sure, if you average 100 of those measurements (actually, you should get
the root of the sum of the squares... because it is power you average,
not voltage), you might reduce that uncertainty to around 0.05dB... but
it is not a very practical manual method, if recording accuracy (ie
writing down the wrong number) doesn't get you, environmental drift will.

The problem with that is in the U.S. the concept that the telephone network is a national resource and should be protected went out with the 1980's.

Competition, low prices and choice are considered far more important than quality, consistency, and reliability.

Considering that several long distance networks have been built in the U.S., one more would not hurt. :-)

> Frankly, the telcos, supposedly, have hardened/semi-hardened system to

That's up to you. I'm sure every telco has a plan for becoming a modern high performance communications provider including voice, data, video, etc at very competitive rates. I'm also sure these plans only come off of the shelf to be dusted off and updated because no one wants to see the status quo changed.

Companies like Vonage, Packet8 and the now defunct SunRocket all came into existance because VoIP was an end run around the regulations that kept telcos charging high rates.

> But hey, a whole other system would be great, if you don't mind the
> extravagant cost of such ... I am of the opinion that the internet

> which even the impoverished can afford--easily.

The problem with that is the cost of sending data. Since the IP part of the network uses packets of varying size, the latency and throughput depends upon how you schedule packets.

In a free for all world, small packets wait in line with big ones, which means all of those BitTorrents kill things like VoIP, on demand video, etc.

In a use the line the most efficently world, small packets get queued and sent in a batch after all the big ones are gone.

In a "we want low latency" (fast interactive services) world, small packets always go to the head of the line and large packets are stuffed in when there is room for them.

"You pays your money and you takes your choice." It's just that people expect to pay very little money and still get their choice.

Geoff.

The Stationmaster I'm familiar with is an end-fed collinear for VHF...
doesn't sound quite like what you're speaking of.

End-fed halfwave antennas for HF seem fairly simple to make, but also
seem to have a reputation for being a bit tricky to get working well.
The usual approach to matching is to use a tuned tank circuit, feeding
the tank either inductively or at a tap point partway up the coil.

http://www.aa5tb.com/efha.html shows one approach... this one uses an
inductive link to feed the tank.

The page at http://www.smeter.net/feeding/tunehalf.php has a copy of
an article by Reg Edwards G4FGQ (SK) which shows the "tapped coil"
approach, and has a link to a copy of Reg's program to do the
necessary calculations.

Your arguments sound very "standard" to me. However, in the real world, if reality is stripped bare of all lies and manipulations of power and money, it would look like the plan to bring free wifi to my city:

Companies are available immediately. The cost? Ads on pages. Yet, instead of my city negotiating how many ads and working out an agreement to where the ads would always be small, acceptable, and even into future times--the city is, instead, causing a bidding war between these companies which will cause them to have to inundate me with ads to be able to PAY THE CITY (raises, retirement, benefits, cars, gas, parking, and other perks, etc. for the b*st*rds) for PROVIDING "FREE" WIFI!

I am getting screwed. Every citizen in my city, IMHO, is getting screwed!

Some things just look simple to me ... this stands as a model to how things are done today--very badly, and internet availability is only a larger model of the one I just presented.

Indeed, I doubt many which are getting screwed even feel the "lovin'" the "powers which be" are giving 'em :-(

Source record: 36875

Hi

Original OWA 14MHz yagi element diameters and element positions make
good results on simulator.
Now I have plan to use tapering from older elements already available,
but this seems to make too much offset
compared to original OWA in simulator. (The element tapering would be
in three sections, 1st: diam. 1" , length 72", 2nd: diam. 0.875",
length 66" and the tip diam 0.5" instead of four sections used in the
original)

What could be reliable optimizing simulator (free ware) to fine tune
the element lengths and positions ?
Or is it even possible to get equal F/B and impedance matching as the
original dimensions show ?

Mike,

You are more likely to get an answer by asking the question in an Australian context... but then a.r.a.m is a pretty uncivil place.

Next you could try Google, and it would turn up an article on Ron Bertrand's RadioElectronicsSchool:
http://www.radioelectronicschool.net/files/downloads/Stationmaster-3.pdf
.

Is it a good antenna? Well it seems to depend on the feed line as the 'other half' of the vertical dipole, so you should be assured of high current on the outer of the coax.

There may be other articles.

I note that quite a few of our new six hour hams with their shack on their belt use their Stationmaster unmodified with an ATU at the transceiver... and it 'works real good, SWR is 1:1'. Still, that is the downside of looking at the world through a SWR meter.

Owen

Been there, done that. Had a company in formation, business plan
written and an angel investor lined up. Start small (a few streets,
the food court at the mall, etc). Some value added services for money, a
brand name picked, and some interesting technology for better location
than GPS.

We even had some interesting technology for providing ads, that we
were going to patent. Although the company never happend, other people
invented it again, but never bothered to patent it, so if we ever
get going again, we can use it. :-)

Then the city of Jerusalem announced that Intel was paying to "wire"
the city with free WiFi and our investor disapeared. It's now 2.5 years later
and we have a tiny, badly run network because the city council refused to
fund it, Intel's free hardware did not cover much (we have a very low radiated
power limit here).

Lots of restaurants now have free WiFi for their customers, because people
would ask the security guard at the door if they had free WiFi and when
they said no, walk on.

Besides funding BPL, didn't Google make a claim to do it and never
deliver? How many places had networks in planing which were abanonded
when they heard who the competition was supposed to be?

> I am getting screwed. Every citizen in my city, IMHO, is getting screwed!

Happens everywhere. Same thing happened in Philly with cable TV. They spent
10 years arguing about the critera, and forced the bidders to sell basic
cable for $2-$3 a month. In the end 3 of 4 sections of the city went to
Comcast, with a minority owned company getting the 4th. The day after
the contract was signed, they sold out Comcast at an enourmous profit.

Before the first wire was laid, the prices went up. The FCC ruled that a
local government could not regulate the price of cable services.
Needles to say, what was supposed to be $2 was closer to $20.

Geoff.

How crowded?

CQ WW DX contest 2005 received 4430 logs for SSB, 4100 for CW. We all
agree that these events increase activity on the HF bands many
fold. How many of these are actually transmitting at any given time?
1000? (A few may be transmitting and listening at the same time, but
there are many more who aren't active for the entire permitted period.)

So how many simultaneous transmissions are there on the HF bands when
there isn't a contest going on? Low hundreds seems more likely.

When I use my antenna analyzer, I'm normally twisting the frequency
control back and forth trying to find a resonant point, so it's not as
if my few milliwatts are going to be on any frequency for more than a
milli-second, much less rise above the static crashes...

I built some 15m and 10m owa's a few years ago and used slightly different tapering. What I did was to first find the resonant frequency of each element as designed, then match the resonant frequency of the element with the new taper by adjusting the tip length. The overall design came out very close to the original specs, so I didn't worry about further optimization.

I used K7NV's yagi design (Yagistress) and EZNEC, but you could probably use a variety of tools to do the same.

Well here it goes.
I have the above antennas made by Hygain 1 of 70-30 Sat and 1 of 216 Sat
The problem I have is that the physical footprint of both theses antennas
are to long for where I want to put them.I can make the boom shorter by
removing a section of the boom from the directors end,what I mean by
removing is to undo the the coupling on the boom and this would save me
about 5 feet of boom length.What I was wondering is what ramification this
will present.I realize I will loose some gain,but what about all the other
electrical characteristic will this effect (bandwidth,inpedence,swr etc.)

High Mike,

The stationmaster is a HW end-fed antenna with LC matching section (L between center of coax and radiator, C is capacitance between radiator and radiator support construction).

You can make such an antenna for other frequencies (I did it recently for VHF air band). The advantage of the HW over de 1/4W antenna is the feed point impedance. Depending on the length/diameter ratio of the radiator, the end-fed impedance varies between about 300 Ohm and 3 kOhms. When the radiator is horizontally, close over a reasonable conducting ground, end-fed impedance may rise up to 10 kOhms. This will result in High Voltage at the feed point as well.

The ground current (or coax screen current when no ground construction is present), is about a factor sqrt(Zend-fed/40) lower with respect to a 1/4W antenna (can be a factor 8). As long as the impedance that is used as ground (or counterpoise) is far below the end-fed impedance, the antenna works well. Gain and radiation pattern will be same as for HW dipole.

There are some things that can go wrong. Most people tune by changing the length of the antenna. That may result in the radiator to work off-resonance, reducing the end-fed impedance and increasing the feed current for the counterpoise. So in my opinion best thing is first tune the antenna (without matching network and low power) to minimum counterpoise current (measure with current probe) and then do the matching network.

For the LC matching network, the C can be the capacitance between the radiator and the metallic structure that supports the antenna. I prefer the LC network above the LC tank circuit because of the higher Q-factor of the tank circuit. This reduces the useful bandwidth of the antenna significantly. As the matching is under the radiator, tuning is not that easy.

When you need further information, don't hesitate to repost.

Best regards,

Wim

When I scan the bands, I hear quite a bit of activity. Those who have
problems hearing other folks should first check their antenna system.

To the above:

Frankly, you are just not important enough to "chew your A55." Now
don't get offended--that is just NOT what I am about ...

> You might want to compare the bandwidth of optical cable vs BPL and
> how quickly the Nyquist limit is reached on each before running off so
> at the mouth about bandwidth.

To the above:

This: "The resulting BPL (Broadband Over Powerline) should be a lot
faster than DSL, with theoretical transmission rates hitting between
256k/s and 2.7 MB/s."

From here:

http://gizmodo.com/gadgets/it.s-electric/directv-offering-powerline-broadbandvoip-289638.p
hp

I may have points to argue, I may be rather "energetic" about arguing
these points. I may not choose my words to "please" others; but, pick
on 'ya by design? Naaaa ...

Oh. And, by the way, BPL is only in its' infancy--count on improvements
on a fast and furious basis.

And, I think here in the USA our phone lines should ALL be optical.
Video Phones in every home, etc. But then, I don't run the USA!
Installing a optical cable and maintaining it in my home would be
wonderful! My TV, stereo, phone, computer, etc. would love it! Well,
I'd have to throw out the ancient phone and get an optical digital
one--but, I'd manage ...

> Yes, anything less than 4 digits is just about useless.

That would be necessary but not sufficient.

I suspect that other aspects of the measurement introduce greater uncertainty than the voltmeter. For instance, do you know the reflection coefficient of the load to 4 digits? (that would be knowing Z to about 0.1 ohm, at the RF frequency of interest), and is it stable with temperature to that level?

For instance, a high quality load from Maury Microwave (a 2610F) is specified to have a VSWR of 1.005 from DC-1GHz, which is a reflection coefficient of 0.0025. But that's only at 25C.

An Agilent metrology grade cal kit with N connectors specifies rho<0.00398 for the lowband loads, but only within 1 degree of the specified temperature.
See, for example:
http://cp.literature.agilent.com/litweb/pdf/85054-90049.pdf

A good thinfilm resistor might have a tempco of 5 ppm, with metal film being around 50 ppm, and thick film more in the 200 ppm area. For a 100 degree change, that's a 500 ppm (for the thin film) or a reflection coefficient change of 0.00025. Clearly one doesn't want to use any old resistor for the calibration load here.

Measuring RF power to an accuracy of 1% is challenging. Your system is measuring a change in noise power of 100K out of 300K, roughly, so you've got a 30% change in noise power into the system.

The Y-factor method essentially plots two points (one at 273K another at 373K, if you're using ice and boiling water), and then calculates the intercept at 0K. Since zeroK is about 3 times farther away than the measurement's width, errors in the measurement are roughly tripled at the intercept, and then doubled because you're using two measurements, so an error of 1% in the power measurement leads to about 5% error in the NF (if you're around 100K) (and this also applies if you have consistent errors.. say both power measurements are 1% high, the NF will come back as 105K instead of 100K).

A 5% measurement uncertainty for power (0.2dB) gets you about 25-30% uncertainty in NF.

The best way to improve the accuracy is to push the low temperature lower (e.g. with dry ice (195K) or LN2 (77K)), but that, of course, aggravates the change in reflection coefficient of your load with temperature.

22g2000hsm.googlegroups.com:

clipped... a nice description of an end fed vertical half wave with
matching network.

Wimpie, I think the OP had using the stationmaster radiator element
unchanged on lower HF bands.

You could view this as a 5.5m long radiator sitting on say, a 4m metallic
support mast, fed at the junction of the two. Typically the configuration
involves no radials at the base of the 5.5m radiator, and an shabby
connection to earth at the base of the supporting mast.

If at 80m you were to assume the earth resistance was as good as 30 ohms,
the earth loss alone would account for 60% of the power reaching the
feedpoint when the antenna is modelled without provision for current on
the outer of the feedline.

So, the StationMaster as described in the article is typically a ground
mounted ~1/8wl vertical with an inadequate ground system, elevated feed,
high sensitivity to noise, highly susceptible to RF in the shack unless
the feedline is decoupled adequately.

It is a little better on 40m, but all of the issues remain.

A lot of the guys wanting to do such a thing are our new six hour hams,
and they would be principally interested in 80 and 40m.

Owen

Hello Owen,

I was expecting that he would scale the design to another frequency to
assure half wave operation at the design frequency.

If one is really planning to do what you described (using the 5.5m
radiator from 80m..40m and upwards), it is a far from optimal choice
for transmitting. At 80m, the radiation resistance is still less then
2 Ohms, at 40m about 7 Ohms, so assuming 30 Ohm ground resistance will
result in a poor efficiency (about <6% at 80m and <19% at 40m). Off
course when one makes a large ground network, efficiency will be
better.

Best regards,

Wim

Hi Tor, thanks for the help
...it seems to be proven method as I did quick check and
F/B shifted very close to the original and impedance curve was quite ok.
This was very quick as I already had both sw's.
Actual impedance measurements must wait the monster is up probably next summer...

I think you will find they are very easy to build. The only adjustment
that might be needed is the tip lengths on the driven length, which might
vary somewhat depending on the lead lengths on your balun. But I found on
mine (I built two 6 el/21 Mhz and one 6 el/28 Mhz) that I didn't need to
adjust anything in the actual antenna. No adjusting matching networks
since they are 50 ohm Z anyway.

I used insulated element brackets, if you use metal plates you might want
account for that.

The one thing I don't particularly like about the designs I used is that
they are hard to side-mount (with a rotator) on a tower, since one element
is very close to the center of the boom. But they seem to perform quite well.

979. Photon vs Wave emissions from antennas?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-29 19:53:25 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <fb4is3bln1@registered.motzarella.org>
Source record: 36747

Ok. You might ask me, "Why do you laugh at people discussing antennas emitting photons?

And, I would answer:

Photon emissions from an antenna element(s) seems difficult, at best, to visualize (no pun intended.)

Consider a 1/2 inch dia. single element antenna (monopole?) If the thing is emitting photons, one would think the photons are being emitted equally around the elements circumference.

Well, now flatten that 1/2 dia rod into a very thin ribbon--however, the ribbon still has the same area of cross section, and equal to the cross section of the round rod. If this conductor is emitting photons, one would expect them, now, to be off the two flat sides of the element and relative few off the sides--indeed, one would now expect this element to be becoming directional in two favored directions--off the flat sides ... to date, I have NOT been able to measure an acceptable difference to reinforce the "illumination properties" of the element.

The photon/wave properties of rf still remains a mystery ... and proof hard to come by.

Regards,
JS

(You don't close quotes is one larf. Why people laugh is a condition
of creationist-like explanations that attend the topic.)

>And, I would answer:
>
>Photon emissions from an antenna element(s) seems difficult, at best, to
>visualize (no pun intended.)

The explanation is simple. Because of the pun (intended or otherwise)
too many expect that the experience of "seeing" is sufficient to
understanding "visualization." Nothing could be further from the
truth. The quote that follows provides sufficient evidence to this:

>Consider a 1/2 inch dia. single element antenna (monopole?) If the
>thing is emitting photons, one would think the photons are being emitted
>equally around the elements circumference.

This confuses thinking with visualization now. Unfortunately it
proceeds from a false premise. It is also a false premise if we
simply ignore "photon" and discuss this in the rather more prosaic
term of "fields."

All points of all surfaces are active emitters. Your "perception"
(visualization) is a far field response of the total contributions of
all sources and their phases. This perception creates an "illusion."
Illusions are fun and interesting, but they bear only on cognitive
issues, not Physics.

John

Imagine your ribbon antena flattened to the thickness of a razor blade.
Instead of using RF, heat the antenna with a blow torch until it becomes
white hot.

It is only when looking at the exact edge of the antenna that any
appreciable drop in light out put will be noticed. At all broadside angles
an appreciable amount of light would be seen. The same effects can be
expected to occur at RF but the majority of amateur test equipment would not
have the resolution to measure the dip with the antenna edge on. The width
of the receiving antenna and diffraction effects would tend to hide this in
the far field, and alignment, reflection effects and manufacturing
tolerances in the near field.

An example from nature can be seen when looking at the planet Saturn. The rings are clearly visible through even a small telescope except for a couple of weeks when they are aligned exactly edge on to the earth. Even at very oblique angles, enough light is reflected to make them quite visible.

Intersting debating point as to whether it is a fairy tail!
May I point out that a H bomb explosion creats via the velocity of the
explosion
radiation with out the use of a resonant element! In the old days we
used a spark gap to create
radiation again without a resonant element! Tho scientists would say
that it is a consequence
of time varient current and thus settle on the current change of
velocity ie accelleration, They could have easily stated that
radiation is pulsed form after all current does go thru zero and
Newton himself phrased it as "packets"
of radiation in his day. But keeping to the same rules of the Masters
of what creats radiation one could easily see from the explosion
theory that radiation is created by the exchange of energy between
capapaciters and inductance
each of which provides a explosion when shorted at the end of each
cycle which promotes the particulate theorem without conflict with the
Masters. I would remind you that "Gausses theorem" with respect to
equilibrium supports the particulate theorem which to the surprise of
many is supported by Maxwells equations. I read the reply that you got
but I could not determine his position if any or what points he was
trying to make...if any.
A point to ponder on, capacitance and inductance are both capable of

energy storage and shorting the terminals is time varient to eject particulates at a high velocity thus creatin two pulses per cycle and where in their absence scientists have only time varient current to hang their hats on for the wave theorem.

You'd have just as much trouble understanding the behaviour of visible-
light photons, given your desire to view them, apparently, as you
would billiard balls or some other macro-size physical object. You
might enjoy reading how Feynmann described the behaviour in his
physics lectures at Cal Tech. It's something along the lines of,
"They behave differently than anything you have any experience with.
Much differently."

On the other hand, there's probably not much utility in discussing
photons of, say, a 14MHz signal, simply because the energy contained
in one quantum at that frequency is so small that you won't be able to
detect it: a little less than 10^-26 joules per photon. At one
photon per second, that's under 10^-26 watts, if you collect all the
energy. At 50 ohms, that's less than a picovolt. Noise in a 1Hz
bandwidth in a 50 ohm resistor at room temperature is about a
thousand times that much. -- Yes, the energy is quantized. But the
quanta are going to be _very_ difficult to distinguish.

Cheers,
Tom

If there are, indeed, as many photons being emitted by the thin edge of the ribbon, as by the broad edges, what law/effect/affect is being demonstrated here?

Or. why are the photons "drawn" to the thin edge with such magnitude of force?

If this ribbon was white hot (even infrared) a meter would indicate more energy from the greatest surface area. Occams' razor is wrong, again?

I have never read of the phenomenon you seem to be suggesting here ...

Or perhaps more appropriately, with visible light being around 500 nanometers wavelength, imagine your antenna wire being about 0.01 nanometers thick and 1 nanometer wide (and 250 nanometers long, if you wish) ... Now does you intuition tell you anything useful about the angular distribution of emitted photons? I suppose not.

Cheers,
Tom

The eye, like the ear, has defects, in the fact it is not linear.

However, if a ribbon the width and depth of a razor blade is white hot,
a light meter available and rotated around this ribbon--the least energy
would come from the side, the most from the flat. There would be
something of a linear graph in the 90 degree rotation between thinnest
to broadest ... please, don't attempt to kid a kidder.

My intention is to use this antenna on the 10 meter FM section of the band. I have been given a 1/2 wave "Ringo" antenna that is missing the ring. I intend to convert it to the "stationmaster" type antenna as I think it will be easier to get the matching system right using a coil spaced from the bottom of the radiator than try to make a new matching ring etc. Thus if I could locate plans for the making of such an antenna it would save me a fair amount of time in the calculations and cut and try type of antenna building.

The info collected so far is at least a starting point for the conversion of this antenna.

Thanks to all who have given input, it is greatly appreciated.

Mike

How is it that you guys are comparing the photon, a sub-atomic particle without mass, to electromagnetic radiation/waves? I don't see a basis for comparison.....

Try the combination of all amplitudes and phases at a distance (pretty
usual stuff already covered).

What force? Give us a number, Tom did.

Consult Planck where it (predating the term photon) is summed up in
two variables and one constant.

This: "Firms like Rubitec and NetTel Africa at the event unveiled cost effective technology solutions that will help operators power their cell cites, tackle their power challenge and ensure continuous quality service. NetTel unveiled a Broadband carrier technology called BPL that couples or injects broadband signals at frequency range of 1.705-80MHz by conduction over Powerlines. Broadband enables the simultaneous transmission of data, voice and video on the same medium at a speed faster than the primary rate ISDN at 1.5 (T1) or 2 (E1) Mbit/s, while Powerline is the medium used for transmission and distribution of electricity to the utility consumers."

Hi Ed,

Mass as a basis of comparison implied:
How much do your electromagnetic radiation/waves weigh?
How thick is sunlight on your arm while driving?

If they don't compare, then these questions should reveal differences
when light is substituted for waves (and versa-visa).

Ed:

In a nut shell:

Light displays the qualities of consisting of photons AND waves.
Naturally the question arises, "Is light composed totally of one or the
other--or both?" (and, you can propose all sorts of side questions from
this one ...)

Some argue that this extends to rf also (at the top of the microwaves
there is the infrared, at least enough to gain ones' attention.) And,
some even go as far as to say rf is composed of photons--ONLY, but these
have wave qualities.

This URL should get you well established on the ground floor of this
ongoing debate and "friendly" argument:

http://en.wikipedia.org/wiki/Double-slit_experiment

The 14MHz photons are being emitted by the whole antenna, not by "broad edges" or "thin edges" as you suggest. You seem to be thinking of them as little tiny balls, or some such. That mental image just doesn't hold water. As I posted elsewhere in this thread, photons do not behave like billiard balls. They don't behave like anything you have encountered in the macro world we live in.

There are some decent "modern physics for the masses" books that will explain to you some of the behaviour that you will probably think very strange, if you are thinking in terms of how the macro particles you're familiar with behave. Even particles like electrons, neutrons and protons don't behave like large spheres. They have distinct "wave-like" behaviour.

As a start, it would probably help if you dropped "wave" and "photon" (particle) from your vocabulary when dealing with things like this and realize that the antenna emits a stream of quantized energy, with characteristics that can be described accurately without resorting to "particles" or "waves". If you had no idea what a passenger airplane was, but you were familiar with birds and busses,

would you get into a discussion about the new thing being a bird and not a bus, or a bus and not a bird? Or would you realize that it has some characteristics of each, but is neither, and deserves a description all its own? Quantized radiation is rather like that. You will NOT describe it accurately as either "waves" or "particles" (in the macro sense).

Cheers,
Tom

The following of yours is very interesting, very descriptive and sounds very scientific.

So now, the only question left, which seems implied by you, is, "Do I get it?"

To which I reply, EUREKA! YES! Indeed, since we got rid of photons and waves--we are only left with quanta! And, if we now construct a "quanta-antenna", such as you imply, we can have a "160 meter earth scorcher" the size of pin head which is just as an efficient radiator as the MONSTER in my backyard!

Thanks for the explanation--I won't forget you for awhile! <grin>

I tried something similar in the past but had trouble with the
capacitors arcing at 100 watts. Better reults were obtained using a
stub made of ladder line. No coils No caps. Antenna was a temporary
half wavelength vertical made of 1 inch electrical conduit working
aginst a 6 wire groundplane. Base insulator was a beer bottle.

The more I think about this, the clearer it gets.

What was wrong with me? Considering photons as little weightless,
billiard ball shaped "chunks" of energy?

I missed the boat, and early on--thick skulled and as slow as they come.
I now see 'em as cubes, tubes, polygons, irregular, indescribable,
ghostly, luminous, streaming strings ... of chunks of energy!

Yes, that is it, strings! And, it all fits! Dr. Michio Kaku has been
spouting string theory off the tops of high buildings for years--ahhh,
if only I'd had not been so dense--for so long ... :-(

Yes. This is quite better than my slow acceptance of the ether and "our
matter/energy" only existing as an "altered and unnatural form" of this
very same ether ...

I swear, sometimes I just need someone to save me from myself--my new
wife is beginning to, frequently, point this out to me--thank goodness!
Maybe next time, I just might have the good sense to listen. <grin>

My photon emitters are: a flashlight, TV, computer monitor
and
my photon receivers are : eyes, cameras, and binoculars
my antenna only reflects incidental photons.
The amount of photons reflected is proportional to the exposed surface area.
amazing.
can you capture a photon and release it at Will?
Would Will need to duck, or would blinking suffice?
Is a photon a particle, or does it conform to the wave theory?
Since light cannot escape a black hole, can we assume light consists of
particles with mass?
Can these particles move slower than the so-called 'speed of light'?
Does high tide affect the speed of a photon?
At what point does a gravity wave affect a photon or light wave?
These questions need answers, gentlemen, so lets get with it.
Let me know when you're done.

...

Just following through on the '4 digit' issue...

I have done two series of 250 measurements of audio noise voltage from a SSB receiver using two different digital multimeters, the 9932 is a modern digital multimeter that is NOT true RMS responding, and the 506 is a modern digital multimeter that is true RMS responding with bandwidth adequate to cover the receiver output response.

From observation with a stopwatch, I estimate that the 9932 updates 3 times per second, and the 506 updates 2 times per second. The integration times are probably .33 and .5 seconds respectively.

I have measured the receiver equivalent noise bandwidth and it is 1600Hz.

95% of 250 readings were within 0.41dB for the 9932 and 0.31dB for the 506. These observations reconcile well with my Chi-squared based estimate

of the uncertainty that I referred to in an earlier post.

As for the number of digits, they are both 4 digit multimeters which doesn't mean a lot. They were used to measure 200mV with 1mV resolution, so the representational error is 0.04dB. The error due to the number of digits in this downscale three digit application is insignificant compared to the sampling error of 0.4dB and 0.3dB.

Graphically, the distributions are shown at http://www.vk1od.net/nfm/temp.gif .

Different meters with different integration times, and different receivers with different noise bandwidth will result in different outcomes, but I argue that the uncertainty is predictable.

Owen

So Cecil , what should I call incoherent photons?
<and welcome back>

Anyway, back at the ranch, no one has brought up quantum electrodynamics (Feynman would be unhappy - since all the photons leaving the surface of the white hot, rotating, razor blade will occupy all possible paths from there to your eye - including having all of them emanate only from the razor's edge for an instant)

And, no one has invoked Schroedinger since looking at that photon will cause it to disappear...

Now, let me discuss Alice - had Alice taken more of the potion and grown large enough that the lens and retina of her eyes were millions of 80 meter wavelengths across, she would indeed see your antenna glow with pulses of 'light' as you key your transmitter, dit dit dit dahhhhhh...

Speaking of which, I now feel the urge to put Beethoven's Fifth on the turntable...

Hi Owen,

The convention for decades has been to describe them as 3ï¿½ Digits, or 2000 count, not 4 digit unless they could represent 9999. Adding digits does not generally add precision, resolution, monotonicity, or accuracy. However, as it costs money to add a digit, the underlying circuitry could usually support "some" of these attributes. Better instruments perform rounding after the last digit.

I don't know anyone here that is that way. I do know people who have the temerity to question wild claims, and not accept them as fact until good and compelling proof is offered, or if it at least "works" to a close approximation. It is a mark of wisdom to understand that is prudent, not foolish.

Has a person stopped asking questions if they ask a question about some new and unproven concept?

The idea is to answer or discuss the question, not deride the questioner.

Otherwise we sound like:

John, to debate Proton s is to first describe it correctly.
Some would say that protons are without mass and composed only
of energy and onlso have momentum! Newton is quite clear that one has
to have mass to have momentum
and all the masters would state that you can't have equilibrium if a
photon does not have mass.
With respect to waves scientists state there are two types of waves!
It would appear that more experimentation is to take place before this
can be resoved.

"The photon/wave properties of rf still remains a mystery ... and proof is hard to come by."

Proof of the wave property is abundant. Electrical energy escapes into free space in the form of waves. Countless observations prove it.
The wavefront is composed of the electric and magnetic fields at right angles to each other and both are at right angles to the direction of travel.

Direction of the electric flux is called the polarization of the wave.

Voltage on a wire properly aligned with the electric field varies along the length of the wire and not very much across the width of the wire.

Best regards, Richard Harrison, KB5WZI

Hi Arthur,

They would (without breathless exclamation) explain they are ordinary and for centuries have been called transverse and longitudinal.

>It would appear that more experimentation is to take place before this
>can be resoved.

For those same centuries, experimentation has been ongoing and has no implied necessity of stopping to ponder (aka resolving) any new wonder of Physics. The only surprise can come from one who misapplies these conventional terms - NEWS at 11!

In that regard, the news is sadly of the Fox headlines variety that streams across the screen below creationist-intellectuals (sic) screaming about the pollution of science (sic) with humanistic left-wing bias. Those snippets of disneyfied science will inform (sic) you about mind control through sonic waves never before known (sic) to have that ability.

A scientist would explain it was due to enormous power levels compressing the medium to non-linearity wherein a second source could mix with it to produce heterodyning. The second source could be modulated with a voice such that the target (a person) would hear "God speaking to them." That being the breathlessly announced mind control. I should quickly modify that with: a scientist would attempt to explain, but sonic mind control of the rather more prosaic means of yelling would overwhelm him, followed by a break for a commercial and the hosts' call for Fox security to take the heretic away.

Sound, by the way, consists of both transverse and longitudinal wave components. This becomes meaningful if your detector (antenna) is small in relation to the wavelength. And as few relate Photons to sound, they should be advised the two are quite integral to the most commonplace reactions. For some, this may take quite some time to resolve.

Gotta be a bit careful there, because quantization error has a uniform distribution, so the variance is 1/12 of the span. This is different than the (presumably) normally distributed actual measurands.

When giving an uncertainty (sampling error), one should also say whether it's a one sigma, two sigma, or 3 sigma number. *Standard uncertainty* is 1 sigma... *expanded uncertainty*, often given as a +/- number is usually the 95% percent confidence interval, which, for normal distributions, is 2 sigma

given your statistics above, you would be giving the expanded uncertainty as 0.41dB

By the way, unless your device actually directly measures dB (e.g. it has a log detector) or the errors are inherently ratios, it's probably better to give the value in a linear scale (milliwatts?) with the uncertainty in the same units. That gets you around the "ratio" problem where log(1+delta) <> -log(1-delta)

http://physics.nist.gov/cuu/Uncertainty/index.html has the simple explanation, and the technical note (TN1297) , and references to the ISO Guide to Expression of Uncertainty in Measurment (aka the GUM)

The error due to the number of

Agreed. Evidence is that the particles are separated from its
companion radiator
into space and those that do not escape are drawn back to the
radiatior where it decay's.
There is no "abundance" of evidence to either side of the particle
wave debate,
only the evidence that has been chosen for the moment at least until
the printer of science books get back to work again.
Ofcourse some say if it is in a book then that is what is correct,
just like on the web!
Of course if one considers that a particle that is projected into
space creates a magnetic field
then the question is what came first, the particulate or the magnetic
field of constant polarity.

Ok, point taken. I think more correctly, the maximum error would be 20
*log(1+1/200/2) or 0.0217dB.

The expected error due to representation in three digits does not account
for the variation in measurements.

> normal distributions, is 2 sigma

Whilst it might be reasonable to assume that the combined error in measurement of a high S/N sine wave voltage might be normally distributed, and that might also be true of measurement of noise voltage in some circumstances, I propose that measurement of noise power in narrow bandwidth with short integration times is distributed as Chi-squared and the number of samples becomes relevant in determining the number of degrees of freedom for the distribution. For this reason, I have talked about a confidence level rather than sigma (which is more applicable to normally distributed data).

Just for interest, in the case of the 9932 measurement set:

Average=0.201, sigma=0.0046, 1sigma based uncertainty estimate=0.20dB, 2sigma based uncertainty estimate=0.41dB, 3sigma based uncertainty estimate=0.62dB.

>
>
> given your statistics above, you would be giving the expanded
> uncertainty as 0.41dB

I stated it as 95% of obs within 0.41, I should have said 95% of obs within +/-0.41, I was explicit about the implied confidence, the 95% doesn't equate to either the 1sigma or 3sigma confidence, it is very close to the 2sigma confidence (95.45%), and it is at the high confidence end of the scale.

>
> By the way, unless your device actually directly measures dB (e.g. it

> problem where log(1+delta) <> -log(1-delta)

I understand what you mean in your last sentence.

I did record the voltage, and converted the values to dB for analysis. The interval was calculated by taking the average of the 2.5 percentile and 97.5 percentile, which is an approximation, but as such small values is pretty close.

I have converted results to dB to make it easier to see the relevance of the error or uncertainty, but in so doing, another (small in this case) error is introduced.

>
> http://physics.nist.gov/cuu/Uncertainty/index.html has the simple

In terms of the above, I am proposing that measurements of narrowband noise with short integration time is not strictly normally distributed, and an estimate of its uncertainty to a given confidence level can be obtained from the Chi-square distribution.

One could not estimate the results of the test from knowledge of the instrument accuracy (inherent and representational error) alone.

I think the experiment supports the proposition that digital multimeters with typically short integration times do not deliver high resolution measurement of narrow band (eg SSB telephony) noise.

Radium

As the article suggests, higher frequencies are considered as being in the infra red wavelengths of light, so 3,438 GHz can be considered to be at the upper limits of radio frequency astronomy.

Visible light, ultra violet light, x-rays and gamma rays are all electromagnetic waves at higher frequencies and are also used for astronomy observations and experiments. Satellites are generally used to observe in the ultra violet, x-ray and gamma ray spectrums as these wave lengths are largely absorbed by the earth's atmosphere.

Remember, there are no strict cut off frequencies where one type of electromagnetic wave becomes another type. Radio merges into infra red which merges into visible light, ultra violet, x-rays and so on. Any limits are purely arbitary ones applied by humans in order to categorise the way in which electromagnetic waves of a certain frequency can be expected to behave.

Look at a colour palette. It is easy to pick out the primary colours. Everyone who isn't colour blind can pick out red, blue, green, yellow etc. But where do you draw the line to decide where red becomes green, blue or yellow? The colours slowly merge from one to another just as the characteristics of radio waves change as frequency increases.

Art:

When we make this final leap, explain that one-more-thing which will trigger that flood of understanding, that revelation, that epiphany--we will only look back and marvel that it took us so long--that we were so close, for so long ...

An example is the atomic bomb. We always knew that if you pile up a lot of pure radioactive material--you get heat--we speculated with a great belief that an explosion from this process was possible. But putting it all together, getting the right isotope with the extra atomic particles available and a system to SLAM! enough of the material together (~2.2Kg) and an "exploding bottle" of force to surround it and keep it together so it didn't just melt/vaporize/weak-poof but would burst out in a healthy explosion, until then, we hadn't really discovered the atomic bomb ...

We stand such a threshold now, this "silence of new discovery" only leads before the "storm of revelation(s)", that very next step may take us there ... or, so I hope.

Somewhere out there is the mind(s) which will accomplish it. We simply need to continue the discussion and search--keep the candle in the window.

Simply put, we need an Einstein and a Manhattan Project.

Or, perhaps we only just need a bunch more high IQ "kooks" in their basements with wires and reactances--thinking and building from their imaginations.

That's very much a matter of convention. It all depends what you choose to call "radio frequency" and what you choose to call something else.

As the article you cite points out, the measurements at 3438 GHz (3.438 THz) blur the lines between microwave measurements (which many would call "radio") and far-infrared measurements (which may would not call "radio frequency").

One source I see gives a frequency of 3.0 THz as the boundary between "microwave" and "infrared". That boundary point is, I believe, entirely one of human convention - there's no magical change in the behavior of the signals as you cross from one side of this frequency to the other.

If you choose to treat the conventional boundary point of 3.0 THz as being significant for the purpose of your question, then one would have to say that the 3,438 GHz measurements you refer to are *not* "radio frequency" measurements, but rather "far-infrared" measurements.

Hi Richard,

It is interesting in marketing hype that reference is made to 2 digit and 3 digit instruments, which implies a log based metric (10*log (MaxReading)) when you assume a 'full count', and the same hype refers to the upper digit if it can only have values of 0 or 1 as half a digit, whereas it probably has a weight of log(0.5) or 0.3... so in utility terms, a 2 1/2 digit instrument is really a 2.3 digit instrument.

In my case, I was making the measurements straddling 200mV, so I needed a bit of headroom for outliers, say 1dB or 225mV fsd, so it was effectively 2.35 digit instrument if you followed that argument.

Nevertheless, the error introduced by the resolution issue and instrument accuracy does not explain the experimental results... something else is happening, and one needs to look beyond the instrument itself to form a realistic view of measurement uncertainty when measuring narrowband noise.

Owen

I am curious here. At some point you have to switch from metallic conductors
and antennas to lenses and other optics. Any idea what the highest frequency
RF amplifier works at?

It's all subject to state-of-the-art. 50 years ago 300 MHz. was complex to work with and 10 GHz. was considered way out there. Today 300 MHz is about as simple as DC and 10 GHz. is fairly straightforward to work with.

I imagine that in another 50 years or less, Integrated hybrid circuits for 3 THz. will be on the shelf items for experimenters to play with.

I would agree..

My question would be whether the original measurement (before averaging)
is normally distributed. I suspect it is, being essentially integrated
noise.

Dunno about an RF amplifier per se.

I do know that there have been some very interesting experiments with
nanotechnology, over the past couple of years, in which tiny carbon
nanotubes have been used as optical-frequency antennas.

http://www.nanowerk.com/spotlight/spotid=1442.php has a brief writeup
on one such.

I have even seen optics and electronics combined in an experimental
Road radar for car control from Philips, radar output was a very small
horn antenna connected to a wave guide, and in front of that they used a
plexyglass condensor lens to make a narrow beam, like you do with light.
Apparently those mm waves liked that plastic lens just fine.

Good answers! - you win my respect.
I saw a program on Public TV a while back, and they were trying to tie Macro and micro mechanics together with a String theory. There were several dimensions, and according to that program, It appears gravity waves might be the only common 'thread' between the several dimensions, and may hold the key to communications from one dimension to another.

Now I want THAT transceiver! A gravity-wave transceiver.

Yup..And after that person dies and only after he dies will people examine
what he found and depending on the favorable publicity of the time will
they consider its validity. To acknowledge its validity while the man is still alive
means acceptance that the man is the smartest of all a tribute that no man
is willing to assign.
For instance, if I stated that I had a dipole for 160 meters that was rotatable
only snarls and laughter would be heard since it is NOT something that one WANTS to believe,
because, if it was really possible he himself would have made it.

It's also possible to use photonic crystals and quasicrystals to
refract and band-process electromagnetic energy across a very wide
range of frequencies... all the way from radio, through microwave,
through far infrared, and into the optical spectrum.

In fact, that would work fine at 10GHz, at 1GHz, and even at 1MHz, though the amount of material you'd have to use for the lens gets prohibitive at lower frequencies. It's all engineering tradeoffs. I know that "geodesic" lenses are used in some radar systems; the idea is that you have the signal travel a longer path (through a curved waveguide structure) in the center of the antenna/feed than it does toward the edges, just as in a convex lens the light in the center of the beam is slowed for a greater distance (and therefore retarded more) than the light at the outer edges.

I expect the boundary between "optics" and "electronics" will blur even more than it is already as both electronics and optical technologies continue to advance.

Hi Tom, we've used plastic lensing since at least the late 60's for focusing mundane 4-12 GHz radio waves. Dielectric refraction was used back then to extract additional gain from dish antennas by allowing more even illumination of the dish without illuminating the area around the dish. Harris radio had a patent on it.

1060. Ferrite cores instead of a 1:1 current-choke UnUn for a Carolina Windom

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-31 02:40:58 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.08.31.02.40.51.569253@from.qrz.com>
Source record: 36828

The Carolina Windom uses a coax feedline from a 4:1 balun at the feedpoint
to a 1:1 current-type unun at the 22-foot point.

Do you guys think that some number of snap-on ferrite chokes of the type
Radio Shack sells at

http://www.radioshack.com/product/index.jsp?productId=2103222&cp=&sr=1&origkw=ferrite&kw=f
errite&parentPage=search

(Radio Shack part number 273-105), wrapped around the RG-8X feedline at
the 22-foot point, will be suitable in place of something like the MFJ-915
"RF Line Isolator" (unun)?

If so, how many should I use? I have four of them now and the local Radio
Shack claims to have some more in stock.

Each of those ferrite cores is about 1.25" long by 1" square. I have no
idea what type or grade of ferrite material they're made out of.

Thanks...

Of undetermined parentage.

>(Radio Shack part number 273-105), wrapped around the RG-8X feedline at
>the 22-foot point, will be suitable in place of something like the MFJ-915
>"RF Line Isolator" (unun)?

Could be. (There is every possibility that the UnUn that comes with
the commercial unit is not suitable - in spite of testimonials to the
contrary.)

>If so, how many should I use? I have four of them now and the local Radio
>Shack claims to have some more in stock.

Put a short length of wire through it, use an antenna analyzer to
measure the Z. Now, divide that number into as much Z as is necessary
to isolate the end of the 22-foot feed point. That is how many you
will need.

>Each of those ferrite cores is about 1.25" long by 1" square. I have no
>idea what type or grade of ferrite material they're made out of.

The previous suggestion renders that moot.

The real question devolves to the parenthetic statement made earlier:
How much Z do you need? It should be 3 to 10 times the Z found at
that drive point. However, with a wild card of the extra radiator
found in the 22 foot drop, it is no longer a simple 4:1 relationship
found at the upper end.

So, we again enter into the exciting world of amateur discovery
through experimentation. Keep choking up until you get the
performance you desire - then stop choking up.

This, then, raises the next real question: What performance are you
expecting?

Hi Owen,

There are also 3000 count meters.

>In my case, I was making the measurements straddling 200mV, so I needed a
>bit of headroom for outliers, say 1dB or 225mV fsd, so it was effectively
>2.35 digit instrument if you followed that argument.

Certainly, but I abandoned multimeters to general utility long ago and
went straight to my own designs for known precision. The common sound
card will give you 65000 count readings; and there is a world of
higher ADCs up to at least 16 million count readings.

>Nevertheless, the error introduced by the resolution issue and instrument
>accuracy does not explain the experimental results... something else is
>happening, and one needs to look beyond the instrument itself to form a
>realistic view of measurement uncertainty when measuring narrowband
>noise.

You get non-monotonicity, quantization error, sample hold time errors,
codec error, issues of conversion errors through flash, successive
approximation, or single/dual-slope methods.

It would be simpler to handle the noise power in the linear domain,
and do the conversion to digital late in the chain (if at all).
Getting out into the hundredths of dB resolution (outside of the
standard 1KHz product lines) drives you into building your own
solution.

Linear circuits in the AF arena have long managed 6, 7 and sometimes 8
place resolution. You might have to twist as many knobs to get the
reading, but you also control the variables. Bolometery solves a lot
of complexities (but that is where this topic started - after a
fashion; and in that regard, optical pyrometry might be summoned up).

The real reason that photons are not a particularly useful concept in RF
design is that they are vanishingly small in energy, due to the rather
long wavelenths. I doubt if there is any equipment that would actually
intercept a MEASURABLE photon at most radio frequencies. You cannot
always say that of short-wavelength gamma rays or even light.

Hi,
I am needing to repair a trap on my beam antenna...while cleaning the corrosion off the windings inside,the last inch or so broke off and I am unable to reattach it.
It is approximately 10 gauge Aluminum wire and as luck would have it I cant find a place around here that sells any. I don't want to buy online as I only need about 2 foot or so.

Any ideas as to what I should do to remedy the problem?

Any help would be greatly Appreciated
Thank You

1066. Vertical antenna problem

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-31 06:56:34 UTC
From: neno <nenadBEZSPAMA@elektro-celik.hr>
Message-ID: <fb8e32$qo1$1@ss408.t-com.hr>
Source record: 36684

Hello,
I build lambda/4 vertical for 20m (i used the fishing pole).
The vertical and radials are build from insulated wire 2.5 square millimeters.
I have used formula on internet and Eznec so I cut 5,09meters wire for vertical and 4 pieces 5.25m wire for radials (i left radials longer so I can cut them to make fine tuning of antenna).
I wanted minimal SWR on 14.050MHz.
But now I have minimal SWR on 12.800 MHz . :-)
According to Eznec if I short the radials for 2meters (so they will be long 3.25m) that will rise resonant frequency around 1.2MHz.
But it is not logic to me. So short radials?
Also according to Eznec if I short vertical to 4.7meters and radials to 4.7meters that will also rise resonant frequency arround 1.2MHz.
Could that be that my mistake is that I didn't calculate the velocity factor for wire.
Maybe i should calculate it because I used single wire instead of aluminum tube.
Or maybe some surrounding objects are influencing. I have metal mast for loop antenna 5meters from vertical.
It is easier to cut radials (because I don't have to take down the whole antenna).
What do You suggest?
To cut only radials to 3.25m or vertical and radials to 4.7m?
What is better?
Just to mentioned that I tuned antenna with tuner and it works great for DXing.

Hello Mike,

In your case, I would try to rebuild the ringo. The construction is not that difficult and the capacitance between the radiator and support is designed to provide the right capacitance for doing the matching. To get your whip to resonate as a half wave, you need that capacitance for making the step from 50 Ohms to about 1500 Ohms (also when using the series coil solution). Instead of aluminum strip, you can use heavy copper wire.

The ringo gives you the freedom to change the inductance (smaller/shorter ringo) and the tap. Because of the DC short it gives some protection against the high energetic LF components in nearby lightning strikes. Disadvantage is the somewhat less useful bandwidth.

http://www.ea8zq.com/ant27.htm gives some info, the text is Spanish, but the images are nice.

http://www.elettronia.it/Catalogo-d.asp?cod=A052 shows a picture of a ringo antenna (Italian site). The ringo has about 2 turns.

Somebody living close to me had also a ringo antenna (with about 2 turns). The antenna could be tuned at the antenna base by extending a tube downwards. I'm sorry I don't have picture.

Best regards,

Wim

Well it seem that Google has the answer.
I found that lot of people are talking about influence of wire insulation on velocity factor.
I didn't know that this influence is so big.
I think that the best solution is to cut radial and vertical to length 4.7m.

Hello Neno,

Influence of PVC wire insulation on wave propagation is just a few
percent. Most of the field lines go through air. I did a calculation
myself (however results are in Dutch language). When the wire is
thicker, the influence of same layer of insulation becomes less.

The soil has significant influence on resonant frequency and steepness
of resonance of the radials. When you use many of them the length
becomes less critical. You can also use elevated radials (for example
about 4 radials 1..2 m above ground).

However when VSWR is OK with short radiator or shorter radials and you
don't have common mode problems in the coaxial feed line, I would not
worry.

When you are still curious, you might model the nearby structures in your NEC file and try to simulate the influence. A mast at 5m distance is within the near field, so you may expect some coupling.

Instead of cutting, you can also roll them up (beginning at the end), so you can re-extend them when required).

Best regards,

Wim

Hi Clayton

Would you consider visiting a welding store? There are lots of aluminum
welding wires (consumables) available.

It seams that many here have aligned themselvezs with modern
relativistic
theories expoused by scientists and lately championed by Einstein.
Yet to do this pushes aside great scientists of the past such as
Newton,
Ohm and many others with phoney thinking. The next decade will push
aside
this ludicrous thinking and move back to Newtonian thinking where
"equilibrium"
was always at center stage. Gravitation is at the center of all
science and to
build on anything else is to place a foundation on sand. Particulates
DO have mass
which thus places it firmly into Newtons Laws of physics areana which
has never been disproved.

Good morning, Richard.

I would like it to work well. :-)

OK, more specifically, I'd like it to show a decent match (that is, a match that's close enough for my TS-940S internal tuner to handle) on 80, 40, and 20, and work at least as well as my 160-meter inverted V that I feed with ladder line and a manual tuner.

I have no way to define "expected performance" any way other than that.

Of course that leaves all kinds of unanswered questions regarding exactly what I mean by "at least as well"... regional / NVIS? (Carolina Windom may not work as well as the V) ... DX? (Carolina Windom may work better than the V at least on 20) ... etc.

I also have no antenna analyzer and no means to acquire one any time soon... best I can do is my transmitter (cranked way back in power) and an SWR meter. No doubt 3/4 or more of my questions on this forum over the last several weeks would have been answered by an antenna analyzer but that's a luxury that's not currently available.

You mention the "UnUn that comes with the commercial unit"... not sure if you meant a commercially-available CW antenna, but this one is being built from scratch using a W2AU-type 4:1 balun and some lengths of insulated copper-clad steel wire I have here.

1073. Convertible 40M vertical to 20M vert dipole

Newsgroup: rec.radio.amateur.antenna
Date: 2007-08-31 15:13:56 UTC
From: Tim Shoppa <shoppa@trailing-edge.com>
Message-ID: <1188573236.141348.44340@r29g2000hsg.googlegroups.com>
Source record: 36691

I am postulating a full-height quarter-wave 40M vertical that is switchable (relays halfway up?) to a 20M vertical dipole.

Seeing as how my two favorite bands are 40M and 20M, seems to make sense to me, but googling to see if anyone else has done this sort of thing in the past doesn't give me a lot of hits. Is this workable? I am not yet ready to go (budgetwise or real-estate-wise) to a real 20M beam and I'd like to increase my oomph for DXing on 40M (right now I have a wire dipole in the trees and am having a blast).

Looks to me I could build an extremely lightweight small 5M high tower with a 5M metal mast on top. (I know, real conductor diameter will mess those numbers up a little bit). And a relay between the mast and the tower would either put them in series for feed as a quarter-wave 40M vertical, or separate the two and let me feed halfway up as a 20M vertical dipole.

How would the ground radials used on 40M potentially mess up the use as a 20M vertical dipole?

One idea for a lightweight 40M full-height tower/mast vertical with insulated-from-ground mounting is shown at http://svc.cc/antena.html

What is the SWR at 14.05? Assuming a good ground, at resonance the SWR will
be 1.5:1for 50 Ohm coax; 2:1 for 75 Ohm.

Actually, it says 3 THz.
3.4GHz is C band, like satellite TV. Ku band sat TV is 12GHz.
There are many off-the-shelf radio instruments available well above this.

You are trying to create a w2du current-choke-balun. Use the RS
devices along with some #77 or #43 ferrite beads from Amidon.
(Known characteristics for less than $5 seems to me to be
superior to unknown characteristics for more than $5.)

Yes, exactly. As I pointed out in another posting in this thread, for
14MHz electromagnetic radiation, it takes about 1e6 quanta per second
to equal the noise power in a one Hz bandwidth in a resistor at room
temperature. I suppose it could be open to discussion exactly _what_
the low energy per quantum is due to. That might be more interesting
than a lot else that's gone on in this thread, so far.

Hi Harold,

Yep. The radar stuff I wrote about is from that era. I wouldn't be
at all surprised to see mention of it from well before that; certainly
we knew about the effect that makes dielectric lens action possible
for RF (which is after all just a continuation of the spectrum that
includes visible light) since before we knew how to generate
appreciable energy at microwave frequencies.

Cheers,
Tom

> What is better?

Or (3) you could leave the radials as they are
and shorten the vertical wire.

The physical environment will shift the
resonant frequency away from that predicted
by EZNEC as modeling is not an exact science.

Any of the three choices will work and none of
them will result in the exact resonant frequency
you desire. In the end, to get the frequency
exact, you will be required to "cut and try" in
an iterative process that often forces you to
add back one inch of the two inches you just
removed. :-)

What you are trying to do is minimize common-mode currents
between the choke and the transmitter. On the eznec.com
web page, Roy describes an inexpensive method of detecting
common-mode current amplitude using a simple toroidal pickup
coil. You could actually measure the relative effect of
your RS RFI devices.

You could use a trap instead of a relay.

Another approach would be to chose a fixed vertical height
to give you a manageable feedpoint impedance on both bands.
For instance, a 25 foot vertical requires an easy to implement
base network on each band. EZNEC says the feedpoint impedances
are 17-j130 on 40m and 200+j320 on 20m, both easily matched
using common network components (or an autotuner).

> How would the ground radials used on 40M potentially mess up the use
> as a 20M vertical dipole?

Ground proximity detunes the radials so length is only of
minor importance. 40m ground radials work fine on 20m.

Oh I don't know about that. I find some of the comments quite
interesting
since it shows that there are some interested thinkers out there who
are interested in relativistic
versus particulate theorems and its connection to electro magnetic
waves.
The thread has certainly attracted a lot of attention from hams
interested in the mystery
of communication transmission beyond the glib and unverifiable
statements made by some .

>SWR meter.

Hi Rick,

Then using what you have, replace the antenna analyzer with the SWR meter. That is, pass a short length of wire through the core you intend to invest in (which begs the question: Why don't you simply go to the right source and buy the right product?) and pour enough power to this "load" to see what it measures in SWR.

If it is the right material (Amidon 73, 75, or 77 material). and the right size (101 size bead) and the right frequency (60M or 12M); then you should read something less than 2:1. Make it two beads, and it would still read something less than 2:1 (but closer to 1:1).

You should note there are three variables above: material, bulk, and frequency. Bulk adds isolation. Material and frequency go hand-in-hand. As you have ferrite of unknown parentage you are adrift on two counts and must accept what this bastard will have to offer. You might be lucky, but it will undoubtedly cost more than doing it the right way.

Anyway, returning to the practical investigation.... A 101 size bead will support perhaps a Watt or two at 100% duty cycle and you can raise that by the inverse proportion of DC. If you pour 100W into this load to read the SWR, I doubt your meter will have a 10mS peak reading capture time (unless you have a Daiwa). If you pour 1W into it, you probably are not going to get a reading at all (that lends any confidence at being accurate). 10W excitation should be adequate and lest anyone complain that the SWR is indistinguishable from that arising due to X (we are seeking R) - I will anticipate that as I have in the past and ask you to grab onto the bead immediately after the reading.

A blister on your finger and thumb will stand in telling corroboration to the reading of nearly 1:1 that the bead exhibits an R of 50 Ohms. A cool bead will be silent testimony to high X. It is sometimes a wonder here how commonsense has to be spelled out.

Now, as you have none of the "right" variables, you need only judge what you DO HAVE in relation to them. Merely repeat this with the Radio Shack item. You need to balance the consideration that

bulk=Resistance and that your SWR reading may rise because it is
either:
1. Doing TOO good;
or
2. Doing TOO poorly.

The Radio Shack bulk may lend itself to presenting 100 Ohms (too good)
or is just sputtering along with 10 Ohms (too poor). As with
resistors, you can judge this through series/parallel combinations to
seek improved indications.

If two loads in parallel bring the SWR reading into 1:1, then you have
your baseline to build out to the proper sized Isolator. If two loads
in series bring the SWR reading into 1:1, then you have your baseline
to build out to the proper sized Isolator. (Amazing what knowledge
can do when you have just a little of it.)

This, of course, returns us to just how many Radio Shack clip-ons do
you need? My guess is they could handle 4W to 8W at 100% D.C. and if
one of them exhibits 50 Ohms you can do the math - depending on your
choking requirements.

>I have no way to define "expected performance" any way other than that.

Then we once again enter into the fascinating world of Amateur
experimentation, an arena that comes with no guarantees and the
prospects of blistered fingers. As you have no way of quantifying
your goal, you have to judge it subjectively (no one else can do this
for you, as you are the subject in subjectivity).

Not knowing what Z is present at the distal end of the 20 Foot
transmission line drop can demand isolation from 500 Ohms to 50,000
Ohms. It is unlikely that the isolation will absorb all the power
your rig has to offer (but if it does, it will make a nice SWR match,
one of those glowing rewards for focusing on the wrong goal). So, by
these metrics, you can get along fine with 10 to 1000 of the mythical
50 Ohm Radio Shack clip-ons.

Start with 10 (adjusted in proportion to their actual R) and add more
until you have met your expected performance. Simple, n'est pas?

Myself, I would base feed for both bands. Say if you used a
"gamma loop" matching scheme for 20m.. Use a relay/relays
to cut the connection from the inductor to the radiator. With
multi-pole relays, a set could be used to connect the feed
directly to the radiator when the inductor is disconnected.
Of course, it would need to be weatherproofed.
I used a similar setup to switch my 40m elevated GP to
a 5/8 GP for 17m. If I left the inductor used for 17m inline,
my resonant 40m frequency was about 6.900 or so.. So I used
a 24v relay to disconnect and bypass that coil for use on 40m.
You could also use a regular coil for tuning the 1/2 wave,
but I prefer a single turn which is tapped at the best point.
If a cap is needed, and it probably would be on 20m, I use
a length of coax. "open at the far end, not shorted".
One thing about splitting for a 1/2 wave.. You gotta have
insulators in the middle of the mast, and then rig a way
to bypass for 1/4 wave use. I guess it's do-able, but I'd
just as soon use a one piece radiator and feed at the base
for all bands. BTW, with even more rigging, it could be used
for 3 bands, if you added 17m running as a 5/8 GP.
All you need for that band is a series coil at the feedpoint.
I used 24v fan relays usually used for switching fan motors,
and ran wire down to a 24v transformer here in the shack.
I'd unplug it for 17, and plug it in for 40m.
BTW, yes I did also unplug and throw that wiring outside
in bad T-storms.. Same as my feedlines.. :/
That wiring ran from the feedpoint at 36 ft, down the mast
to the shack. Could carry a hefty pulse if I took a strike
same as the feedlines.
The radials should be no problem. IE: 1/4 WL for 40m.
I think most BC users that run 1/2 waves, use a field
of 1/2 wave radials.. So, should work out ok I would
think. Besides, any radials on/in the ground are going to
be fairly detuned anyway. A 1/2 wave really needs no
radials, except that ground losses will occur when
ground mounted, same as any other antenna. But
they will be less than a 1/4 wave used on the same
ground mount, and same band. The set of 1/2 wave
radials should keep that loss fairly low. Will be

better than the 1/2 wave ground mounted with no radials.
MK

For what it's worth - last year, I home-brewed a coaxial RF isolator/choke, in an attempt to fix an RF-incursion problem involving our RACES 40/80 trap dipole and the phone system in the building at which the dipole is installed.

I used some fairly large-diameter ferrite beads - probably 43 material, if I remember the impedance readings I took correctly. They were an inch or so long... I superglued a bunch of them together (around 8 or 10, I think) to form a long ferrite cylinder. The ID was large enough to let me get a length of RG-8X through the cylinder a total of three times... in effect, making a very long, thin three-turn choke. The whole thing was installed in a length of PVC pipe with end caps and N connectors.

The common-mode impedance along the braid of the coax turned out to be quite high. If I recall correctly, it was at the upper limit of my MFJ-259's ability to read at 3.5 MHz (probably upwards of 1500 ohms, mostly reactive) and was off-the-scale at 40 meters and all higher frequencies. Whatever capacitive coupling occurred between the turns didn't amount to enough to matter.

[Unfortunately, it didn't fix the RF incursion problem, which later experiments proved was caused by near-field pickup by the phone lines of RF from the antenna itself, and not due to feedline RF at all.]

You could probably build a similar unun using the Radio Shack ferrites. If they aren't big enough to allow multiple turns of RG-8X, you could use a short length of RG-58 or an even smaller-gauge 50-ohm coax. Losses in this short a length of thin coax shouldn't amount to enough at HF to matter, or to cause appreciable heating unless you're running very high amounts of power.

Hmm, dare anyone ask either of you for a simple computation to support
this notion of "mass?"

If Arthur is so wedded to a Newtonian universe, it should be a walk in
the apple orchard.

A very simple question of rotational kinematics:
How much power is required to accelerate
the 1 gram mass of the vanes
from 0cM/s to 1cM/s in 10s?

Extra credit:
How many photons does it take to do this?

Extra special, super duper credit:
What is the weight of one of those photons?

You can use your calculator to convert mass to slugs in an Earth
environment. Of course, this may be an egregious speculation of
ability if the prior compuations are begged (or whined) off with
extraneous demands (not worth Newton's spit) for parsing F=MA.

lots of problems with that... how do you decouple the 20m midpoint feedline from the 40m vertical? how do you get the 20m feedline up there without messing up the 40m performance? where and how do you put and connect radials for 40m?

a slightly more practical thing would be to have a relay half way up to cut off the top section to turn the 40m vertical into a 20m vertical... but the best and most common way is to put a trap at the mid point to cut it off automatically on 20m... add more traps, you get more bands.

That is very, very interesting Danny. I appreciate the work you did
and the beautiful pictures! I see your conclusion that the antenna
must be at least a physical quarter wave on 40M and that matches
exactly my sentiment (if not experience or knowledge) about building
such a vertical.

Do you have any pics/docs of the telescoping 35-foot whip? I've gotten pretty good with building wire antennas and hoisting them up into the sky but have to plead massive ignorance when it comes to whips etc. PY1BEK's lightweight tower config looks pretty sweet though!

Tim.

I decided to cut radials because it was the easiest job considering that
vertical is elevated 9m up the ground.
I cut radials to 3.25m and now the SWR is 1.3:1 on 14.020 .
I left the vertical to 5.1m .
I will test the antenna this days.
Thanks for help.
Eznec was very helpful also.

Thanks for help.
I cut radials to 3.25m and left vertical to 5.1m .
Now SWR is 1.3:1 on 14.020
I hope it will work good.
Eznec was very helpful too.

I'm left with the impression that JS, at least, hasn't a clue about how those little radiometers actually work. (Or perhaps he just thinks he's having fun with a little trolling.) Answers to your questions, of course, won't get him there. Here are a couple of questions that just might: Just how good is the vacuum in one of those radiometers? What happens if you evacuate the globe down to, say, 1e-6 Torr?

Cheers,
Tom

Source record: 36721

Thanks to all for your help on this ferrite core question.

The objective was to see if I could put up the antenna with only what I have on hand... and I have a 50-foot length of RG-8X and four of those radio shack ferrite cores. I also have an MFJ unun and so I could cut the coax at 22 feet and put in a couple of coax connectors, and use the unun, I just hadn't gotten around to doing that and anyway I don't have the connectors (but, the Radio Shack is just down the street).

Someone said "try it and see what works", so I did that... put up the antenna this afternoon. Unfortunately it started raining and the XYL started yelling at me to get my @$$ off of the roof before I fell off :-), so I didn't get the unun OR the ferrite cores installed yet.

I figured what the heck, may as well try it without the choke and see what happens. I inserted the unun into the line where the coax comes in the window and fired it up. It actually seems to work better than my inverted V on 20 meters (only band I've tried it on so far), though the difference isn't exactly what one might call dramatic. Also the SWR is pretty poor but nothing the rig's internal tuner can't handle.

I'll get the cores or the unun up there tomorrow and see how it acts then.

Einstein hasbeenproven wrong many many times.
Einstein also did not produce the Gaussian array
since it would prove him wrong once again.
Haven't you got anything to contribute of a technical nature
other than following news from Minninapolis airport stalls ?

Hi Arthur,

Saying that was simpler than doing Newton's math, certainly.
:-P....
(the web version of Newton's rasberry)

Let's make this simpler. Can you give us the mass of a photon within
6 orders of magnitude?

Can Brett?

And, more important, if I did, would you reference me? (Gad what a
prospect that would be - enough to convert satan to scientology.)

For extra credit for that massive Photon:
What is its dimensions? (radius, distance on a side, whathaveyou)

Extra stupidous credit question:
If a 10 base-pair strand of DNA is 3.5 nM long;
and we have a 550 nM Photon illuminating it;
would it crush the strand?

Hint:
The DNA strand has mass, we can weigh and tell you that, and the
Photon (if massive) dimensions are 157 time larger. Now this may be
like comparing feathers to lead, so perhaps you might know what the
Relative Density of Photons are?

assuming the only problem is the switching a relay could be arranged
to extend the antenna for 40M operation if it was air activated. I
might try making the tower so it was 1/2 wl end fed antenna on 20m and
1/4wl on 40. If you can insulate the base from ground that should be
easy enough to do.

Dear Crew: I am delighted with the content, care, and thought contained in this thread. The continual issue of all measurements comprising at least two numbers (estimate of the quantity measured and an estimate of the uncertainty of the former) needs always to be dealt with. While the law-of-large-numbers suggests that a normal distribution is a good assumption to start with, experience shows that sometimes normal is not normal. The famous paper by Costa (Dec 1959, Proc. of the (wonderful) IRE) about communication in the presence of noise and other signals notes that a Poisson distribution is the appropriate distribution ("Poisson, Shannon, and the radio amateur").

I had the opportunity at Ohio State to craft a system that measured very wide BW noise that changed slowly and to add statistical measures to what was measured. Today, the task would be trivial - a sound card would run circles around what I did with a voltage to frequency converter, accumulator, counter-made-into-a-sidereal-clock, punched paper tape, and an IBM 1620.

It is not enough just to put a number on something. We must remember the early speed-of-light measurements that had a mean that turned out to be outside of latter measurement's uncertainty band. An investigation of the old log books found that not all of the data had been used! When all of the data was used, the mean was within the more modern measurement's span.

John I think the thread just died. Opponnent have no answers
so they pose questions to change the subject. I believe they have no
idea
either way what is correct since they don't know enough to debate it.
Give them time to read a book and see what they can come up with. It
certainly will not be mathematical based on their mathematical
responses
to Gaussian law integral equations and the equality to Maxwellian
laws.

In the U.K. everything is not equated to size as a measure of
importance
and their is a rhyme that goes.... For the sake of a nail a shoe was
lost.
For the sake of a shoe a horse was lost. For the sake of a horse a
king was lost.
And for the sake of a king a kingdom was lost. A little nail can have
huge importance
way beyond its size.
On the other side of the coin when the U.S. exploded an airial H bomb
in the fifties
the emitted radio energy knocked out all of Honolulu's power network.
Since the bomb did not
have an antenna the particulates in the bomb must have had a horrendos
speed
where its energy blew all the fuses. No wonder the millitary
immediatly
returned to tube radios.
Yes Richard, I can see why you think what goes on at airport stalls
is
more interesting
since you are so unlike the rest of us on this thread.

As explained in the text the minimum ï¿½-wavelength for fourty-meters
was to achieve a good match on both bands. Any length from about 33'
will 35' should be fine. There is on real advantage in having it
physically resonate.

That mast is an old military surplus item. I doubt if you could locate
one today. They were used on PT boasts and some Coast Guard cutters
from WWII through the 1950s. Today your best bet would be to use
aluminum tubing or wire strung alongside one of the telescoping
portable fiberglass masts on the market today.

Ah, you are well on the way to exploring the meaning of the term 'works' as
in 'my antenna works real well'.

Don't forget collecting a few DX QSL cards, that is often regarded as the
most conclusive evidence.

Now that you mention it, I saw something on the same principle once, but
it was half a ping-pong ball filled with paraffin. :-)

Cheers!

I like that explanation, a "packet" or a "swarm" of particles
in pulsatic form. That last additive bit is extremely important
because
the escape co ordinates change with each pulse.
This should satisfy those who seem to be more concerned with the size
or
shape of particulates. The bird part is especially interesting since a
swarm of birds
emulate equilibrium in mass form without collisions.

Sorry, I meant to ask whether 3,438 GHz is the highest radio frequency used to receive audio signals from outer space. I should have made my question more specific. Radio-astronomers study sounds from the sun as well as visual data.

I wonder if a space station with a 3,438 GHz AM receiver could pick up any extremely-distant audio signals between 20 to 20,000 Hz [from magnetars, gamma-ray-bursts, supernovae and other high-energy but cosmic objects] after demodulating the 3,438 GHz AM carrier wave.

> Richard Clark, KB7QHC

Uhhh, gawd, I hate to even get into THIS mess... But, somebody has
gotta do it...

First guys, photons hitting the blades of the radiometer do not turn
it by F=MA... If it did <were we so lucky> then NASA is wasting a
hell of a lot of money designing the mars rockets when all they have
to do is have the space shuttle throw out a sail and have their heads
snap back as they are accellerated like a half drunk blond hitting the
gas pedal in a red corvette...
Actually, the radiometer blades turn because infrared energy
differentially heats the black surface of the blade as opposed to the
silver surface, causing it to differentially heat the local air
molecules on that side of the blade as opposed to the silver side...

The more energetic bombardment of the black surace by the heated molecules as opposed to the less energetic bombardment on the silver surface causes a differential in pressure that pushes the blade on its way...
(no Virginia, that is not a vacuum inside the radiometer, just high altitude - and yes there is no Santa Claus - now come over here and sit on my lap)

Source record: 36641

With a tubing vertical you can run the coax up the inside of the lower half to feed the dipole and use relays to switch between base feed and center feed for changing bands... GAP does something similar with traps (after assembling a GAP for a local ham I am not a fan of GAP antennas, their basic idea is sound however) You will need a choke coil right at the base and probably should bury the feedline into the soil as deeply as you can trench it - at least 3 or 4 feet - and have another choke a quarter wave back from the feed point... Lots of work, not much extra cost... Should work OK...
Other way to do it (and my preference) is think like a Ringo Ranger and stay with base feed... Insert a half wave, parallel feed line, phasing section at the mid point and get the benefit of 2 quarter wave in phase radiators on 20 meters... Short this phasing line out for 40 meters.. Again, run the relay wiring inside the lower tube...

denny - k8do
In business as "Solutions are Us" - as long as I don't have to actually do the work!

I haven't done this myself, but I believe you can also use this
technique to persuade a 10m (well, originally CB) halfwave 'Silver Rod'
antenna to work on 20m. You first have to change the feedpoint to the
coil in the base from a tap (typically 1 turn up on a 4 turn coil) to a
simple series inductor. This involves simply lifting the end bottom of
the coil from ground. The 10m matching then becomes an L-match from low
Z to high Z (instead of tapping into a parallel-tuned circuit). The
length of the antenna will then probably need some adjustment.

On 20m, the coil is essentially a just bit of additional loading at the
base of a quarterwave. And you will, of course, need to add some 20m
quarterwave radials. The SWR may not be fantastic, but, if the coax
isn't too long, it can usually be dealt with a tuner in the shack. I
understand that you can also force it to work on 15m.

Putting HF into my Arizona Cadillac. I've seen, but can't find now, a mount for a Hustler (and similar) antennae which fits in a stake pocket on a pickup. Anyone point me to a source?

The Man in the Maze

John, I don't quite understand what you are saying......."encrypts
chits"
that is completely foreign to me. Are you saying wrapped in a enigma?
I have never really understood him so maybe I am missing something!
And that "A55" comment, don't understand that either.

Hi Mac,

Last night at dinner, I had a conversation with a former HP exec and
we rambled on over glasses of Burgundy about how kids had lost access
to "flipping bits" on the computer, and instead played on them. What
this has in regard to the quote above is that newer technology may
have made everything simpler, but the laborious route you took drew
together many issues and gave you a visceral connection to the
process, building an instinct so to speak.

For instance, your allusion to counter-made-into-a-sidereal-clock may
not be fully appreciated for its "sidereal" quality which is a specie
of time with a continuous slip against civil time. This would be a
source of constant irritation for one being tugged away from their
Cesium Beam Standard. (At a rate of something roughly at 4 minutes a
day?)

So in some sense the solution becoming "trivial" removes intuition
from the problem.

Radium

You are referring to "the music of the spheres". The random noises generated by very distant quasars, galaxies, supernovae and other objects.

Yes it probably could and you would hear all sorts of weird pops, whistles and background noise. Just like at pretty much any other frequencies you care to monitor.

Mike G0ULI

WESTERN CONNECTICUT HAMFEST
Sponsored by: Candlewood Amateur Radio Association - CARA

Sunday, September 16, 2007
Table Set-up at 7:00 AM.
Open to the public 8:30 AM to 12:30 PM

Edmond Town Hall, 45 Main St. (Route 25), Newtown, CT Exit 10 off of I-84

Admission $5.00, Kids Under 12 FREE.
Tables $12.50 Tailgating $8.00. (Both INCLUDE 1 admission).

ARRL Sanctioned. Talk-in on 147.300 (+) PL 100.0.

Seminars
- Mechanical TV – Those were the days
- Airmail – How it works, incl demo
- Satellite Communications – How to do it
- NVIS Antennas (courtesy of ARRL)Handicapped Access. Ham Radio Equipment.
Batteries for Emergency Comms. Computers. Door Prizes.
Refreshments. Ample Parking. Rain or shine.

Only 12 minutes from Brewster, NY, 15 minutes from Waterbury, CT.

For information
call: (203) 938 4880 or (203) 775 1946

---------- Table Reservation ----------
Mail to: Candlewood Amateur Radio Association
c/o Joe deGroot, AB1DO,
30 Sunnyview Drive,
Redding, CT 06896

Name:_____
Address:_____
City/State:_____

Please reserve _____ tables at $10.00 each.
Yes / No : I need electricity

Make checks payable to CARA

Hi Denny,

Well, for such a melodramatic dip of your toe into this cesspool, I
hope you brought your snorkel.

>First guys, photons hitting the blades of the radiometer do not turn
>it by F=MA...

Um, given the number of radiometers available, as your first attempt
at this water-polo at least name the one you are responding to.

>If it did <were we so lucky> then NASA is wasting a
>hell of a lot of money designing the mars rockets when all they have
>to do is have the space shuttle throw out a sail

Odd you should so quickly discard one of their proposed interplanetary
spacecraft with a rhetorical flick of the wrist.

>and have their heads
>snap back as they are accellerated like a half drunk blond hitting the
>gas pedal in a red corvette...

It doesn't work that way and certainly reveals the chasm between the
mechanics and the mechanism of the motive power. Your assertion
doesn't even work in the Newtonian universe.

>Actually, the radiometer blades turn because infrared energy
>differentially heats the black surface of the blade as opposed to the
>silver surface, causing it to differentially heat the local air
>molecules on that side of the blade as opposed to the silver side...
>The more energetic bombardment of the black surace by the heated
>molecules as opposed to the less energetic bombardment on the silver
>surface causes a differential in pressure that pushes the blade on its
>way...

Not quite. This was certainly "one" answer, but the numbers don't add
up. It also reveals Tom's bushwhack of the twins when he evacuated
the Crookes radiometer.

The description you offer requires a porous plate which is absent in
every radiometer that has come down the pike (and yet still twist in
the sun to confound the math). As for the local air, there is none in
many radiometers that are more sensitive than the Crookes.

>(no Virginia, that is not a vacuum inside the radiometer, just high
>altitude - and yes there is no Santa Claus - now come over here and
>sit on my lap)

Again, which radiometer? If you are arguing a "perfect" vacuum, then like a free lunch, I would agree there's no such thing. The Crookes radiometer requires a partial atmosphere to work, other radiometers work quite fine with much less.

The distinction in the multiplicity of radiometers is significant and relates to an effect predicted in Maxwell's work, and exhibited by Lebedev; and Nichols, Tear, Hull, and Webb by THEIR radiometers. It requires very little more work than stating the surface area and rendering the expression of force in the units pascals if one wishes to remain within their classical descriptions.

To put a number to it: 0.3 slug per sq. mile (under less than demanding conditions)

If the twins can't cope with the crippling Newtonian math, then one might grant them the mental prowess of scaling by area - something within the reach of a very special fifth grader. Yet and all, this bone that I am tossing them only answers the less than Extra special, super duper credit question.

To keep it in pascals in conditions of sunlight, on the equator, at noon, on the solstice: 3 ï¿½Pa (one square meter is implied, but this is certainly not the size of any radiometer's vane - hence this number should be further reduced by roughly 1/10,000 or 300 pPa). If the twins can follow the mathematical progression in the parenthetical statement, they should be able to answer the less than Extra special, super duper credit question.

Mass of a Photon indeed! If, at that time, Newton had these stellar acolytes surrounding him (a lot of his work on the speed of sound was jimmied to amaze his audience), he would have had to been hit with a vat of applesauce to discover gravity.

Indeed.

This "Radium" personage seems to be no more than a troll who could
answer his own questions by querying the available literature, but
who seems intent on wasting others' time by posting idiocy which
must be refuted.

Really? So, someone should tell the engineers who have proposed the "solar sail?" A massive silvered mylar sail which would be unfolded in space and sail spacecraft on the "solar winds", photons reflected mass--actually.

You guys missed your calling ... you could have been "fact debunkers!"

Regards,
JS

I am having a heck of a time locating a source of good information on how to make an effective common mode filter using the snap-on type ferrite beads such as available at RAdio Shack. Planned usage is for RG-8 coax feeding an SGC tuner, with primary operation on 75 & 40 Meters, but possibly up through 10M. Any help?

Since people who say things like that don't bother to actually know
how to calculate the answer to that, the recoverable solar energy per
acre is 5.25 MW.

If your solar collection is only 10% efficient -- far below what is
common today -- you'd still get 525 kW / acre.

Since covering land with solar panels is not necessarily the best or
most aesthetic or most socially acceptible use of land, consider what
could be done with south-facing rooftops and solar shingles like those
made by http://www.uni-solar.com/

Dear Richard:

Outstanding insight. Too often the big picture occludes the necessary, component, little pictures, and the other way round is just as common.

Two other items about that long ago task might be instructional: One:
I expressed to Prof. Kraus that the outside world expected measures of the uncertainties in what we were doing - indeed, as I recall, a polite and careful criticism had been published. How I had the ability to suggest to a world class scientist that his work could be better is a mystery still. It just seemed like the right thing to do - two Midwesterners talking about what had to be done. I further opined that continuing to measure off of the scratching on pen recorders was not up to the task. Prof. Kraus said: "do it, I have money for bits and pieces." Things like this do not happen any more. So, not realizing that such a scheme had not been dome, off I went to do it. Mind, RS232 did not exist. IEEE488 did not exist. Instruments did not talk to each other in those days. At the end, just the clock and counter/accumulator needed to talk binary to the punch-paper tape drive. The IBM1620 did arithmetic by table-look-up! So the programming was entirely different than anything I ever did again.

Two: The sidereal clock was crafted from an HP counter that used relaxation oscillators as frequency dividers with a reference oscillator shifted up by the slight amount required. Got the thing to read HMS, but the time was off by exactly 1%. I used a scheme that I had made from a BC221 "frequency meter" as a transfer reference to measure the counter's reference oscillator (topic for another day as it involved some interesting math and electronics) and it was right on the money. Well, one of the relaxation oscillators was dividing by 9 and one by 11!
The real story that illustrates characteristics to be avoided by every generation took place when visiting the observatory of a large European country we have not had a war with: they wished to convert a digital clock from civil time to sidereal time, but were such bureaucrats that they were unwilling to process an order to change the reference oscillator! So, I proceeded to describe in detail how one etches a crystal. What they said, in effect, was: "get our hands dirty and take a chance of damaging state property?" As has been said many time by this group: the time arrives when one needs to up and do.

Back from the ramble of an old man to your observations: science and intuition must be coupled. Our younger people have far fewer opportunities to acquire experience that can lead to intuition. The scheme of working half time and going to school half time is one way to overcome those limitations. That is what our school has done since 1919 - no, I was not present at the opening.

Point taken.... although power may be locally supplied by 12V
battery. Or, if using separate 12VDC line, could route alongside RG8 and
use the common mode filter over both? No control cable needed.

Thanks, Paul. That IS a really good run down on common mode filter design, etc. I was "hoping" for a simple how-to using the Radio Shack snap-on beads. I have about a dozen of that type. After a quick read, I believe there was some pertinent info in that writeup specific to what I want to use. I suppose I can simply install a half dozen and see how it works. One antenna system is a 23' vertical on the back of my motorhome, the feed point ground is well bonded to the large chassis underneath, and fed with RG8X. Although base loaded at present, I will Probably end up feeding it with an SGC auto tuner. The other antenna will be a dipole of some sort, fed with ladder line and tuned with another SGC tuner. The common mode filter will go on the coax at the tuner input.

http://www.yccc.org/Articles/W1HIS/CommonModeChokesW1HIS2006Apr06.pdf makes reference to the RS snap-on ferrites being mix 43 (page 25):

"One 'turn' on (i.e., one pass through) a Fair-Rite mix-43, splitbead, 'Cable Snap-itT ' about 1.25 inch long by about 3/4 inch square, able to fit around a cable of diameter up to 1/4 inch. Radio Shack sells these, and many are found at hamfests.
Freq.(MHz) / Z(ohms)
3.5 / 40
14 / 115
28 / 171
There is no angle data here; but note that the variation of Z as a function of f here is similar to that seen above for the string of mix-43 toroids."

Using that info, you'd stack ferrites in order to achieve the impedance you're seeking. At 80m, if you want 400 ohms, you'd use 10 of them. However, I believe it'd be cheaper to stack ordinary ferrite toroids such as Amidon FT82-43 (u=850, AL = 557mH/1000T, 0.516" ID). With these, 400 ohms at 3.5 MHz = 18.2 uH. At 557mH/1000T and one turn per core, you'd use 5.68 cores (round up to 6 cores). Amidon sells 'em for $1.20 ea

Clear?

Hmmm. Sure you don't strive to over simplify a bit? But, ok. When I lay down a bar neodymium magnet, cover it with a sheet of paper and sprinkle iron powder upon it, to see the lines of force--what are those lines depicting? Are those photons? Are those waves? Are you completely sure they are only of static properties--and some type of movement is not occurring just outside my range of vision and ability to measure? Are they contained within a media I cannot see and measure?

It is quite easy for me to generate those same lines of force with an electric energies' flow though a conductor. And, the reverse is also easy to accomplish, I can cause an electric energy to be generated by moving a conductor though these lines of force.

I suspect, in the future, it will be easy to switch matter and energies' states back in forth, with similar ease.

But, at this point, clear? Surely your vision is much better than my own ...

And, if I am unable to get my mind completely wrapped around this problem, to be able to claim I understand this with precision--how would I suddenly be able to make claims about the much more complex?

But, if you have the time, enlighten me, what is gravities relationship to magnetism? Is there a reason their properties share similar characteristics/behaviors? Know of any "iron powder tricks" to allow me to see gravities lines of force?

I think gauss is a link in a chain--not a complete answer in itself, and a chain which is still missing links ...

JS

John,
The moment one introduces equilibrium into the equation it
becomes a whole new ball game. I asked you to do something
with an antenna design, remember. Because therein
lies the clue to all this instead of talking around the houses.
Talking has proved nothing so try my way!
Today I am going to put my 160 meter antenna
onto the top of my tower so that I can try to get the impedance higher
tho it is useable at present on the ground.(Resonated at 20 ohms)
I made one for 80M and it was 60 ohms and the gain was undeniable.
I think only a 160M antenna will get believers so I will use one this
winter
on the bands. Yes I said bands (plural)
Nobody has done this before and I am sharing it with you.
In the next week or so I will attach it to a rotator
to see what the directional pattern is. (Actually I have two styles of
this
new antenna made).
If you did as I asked you may well have that next step that you talk
about.
Seeing is believing so why not take a look for your self.
Send me an Email if you hit a problem. I am sharing it with you purely
to put a lot of these experts in their place so you will have
what they can't have or want. You certainly will be closer to derive
the answer for yourself
Art

Art:

Sorry, but that is/would not be easy for me at present. I have moved into a smaller place. I am getting too old to maintain a large yard/home, etc.--even my antenna experiments are on a shrinking scale. Plus, I do more communications via IRC, instant messaging, email, news posting, video chat, cell phone, etc. than I ever did on amateur bands ... a sign of the times, perhaps.

I have been focused in a much different direction--small, stealth antennas are the mode of the day here--I attempt to stay 10-100 watts, just local traffic with a handful of friends.

Bought a new ford explorer and am not even going to bother moving the rig to it, besides, I have to bring the antenna in if I park the car on the street--cell phone is just too easy. Indeed, the XYL is favoring a 3 bedroom modular in a park with gated security--all cement--no yard--I may end up giving in to her wishes. The new area we have moved into is not without drug/gang/graffiti/ethnic-diversity problems--my own fault (graffiti on the car/fence/house, tires slashed and windows smashed if you leave the car outside at night, stabbing in a park just blocks away, etc.) ... even the nicer areas of town are five bedrooms with five different families of unknown ethnic origin occupying them--frequent marijuana growing busts. :-(

Geesh, I have gotten old and the world has changed--my kingdom for a few good neighbors ... at least at this location I have high speed DSL! (was using clearwire at old place and signal was poor, I had to "hack" the clearwire modem for an external antenna)

I will be looking forward for any information about your endeavors ...

Regards,
JS

That is a good point. I'm not even sure of the vendor of the numerous split beads I have on hand. The ferrite is about 1/2" thick, 1" in diameter, and a 5/8" hole diameter. Don't know the material. The plastic housing is labeled " F / R " with the slant bar being a lightning bolt, and the part number is: 80640* . (that's an asterisk after the zero.)

After some additional Google research, I found them. Made by Fair-
Rite Products Corp. PN is probably: 2643806402. Product description
matches unit on hand, and lists it as type 43 material with a Z around
where I want to operate of about 20 ohms.

Hi Ed,

Read the fine print. This Z probably relates to some "standard" size
item, such as a small bead and not your clip-on. The boon here is
your clip-on will probably present more resistance to common modes.

My guess is that you got the 20 ohms (for an unstated intended frequency of use) by extrapolation of the published data from 10 to 250MHz. You probably also read that the core material is recommended for 25 to 300MHz. Both of these would suggest that the material is not the best for your intended frequency, whatever that is.

So, for an effective choke, you may need 25 to 50 of these things. They are only a half inch long each, so that is just 13 to 25 inches in length in total, not unusual for that type of choke.

Yep, and a center-loaded 40 ft. long wire is better than
a center-loaded assy shorter than 40 ft. on 160m. There
is no perfect substitute for length and height on 160m.

> 2] If I decide to go with a 30 or 40 foot length of bare wire up the

As long as you can make them and as many as you can
manage. Best to check the resonant frequency during
the installation process but you are not likely to
make the top hat too big on 160m with a 1/12 wavelength
vertical wire. Resonating the system using only a large
top hat would be ideal. Of course, you will be dealing
with a low feedpoint resistance, too low to be matched
without a ~1:4 unun or equivalent.

Could I use the whip configuration as the center load coil, and just add
some more wire to the top end of the whip and more wire to the bottom end??

Actually, since I probably will be using RG8X I can most likely
loop a couple turns through each bead... which should preclude the need
for quite as many.

Ok. So you pose your arguments why photons are at play ... I listen, we move to the second level ...

On which, I respond; "Why would the mere length/phasing of elements on an antenna be able to cause one to act as a mirror (the one longer than DE) and the other as a director (the one shorter than DE)?

All I can visualize are swarms of these little energy bundles (their shape is important to some, however, at this exact point, not me) colliding with those being emitted from the DE--then, swarms of these little energy bundles being emitted from the director are only leaving in a forward direction--causing a vacuum and pulling those emitted from the DE along with 'em, and along with those "repulsed" from the reflector ... I really am in need of a good explanation here. I mean, come on now, certainly you can understand my difficulty in following all this--right?

I mean charges on the grid of a vacuum tube can, apparently, cause things similar to these with particles/energy-packets; but, an antenna???

Regards,
JS

Am I right that this is a very short length of coax in a vehicle, and the VSWR will be low due to the ATU at the feedpoint, and that the ATU ground / coax braid will be connected to the vehicle metal framework? So why use thick coax? Why the choke?

If you need a choke, you could get some cores that are a neat fit over RG58, at 10MHz appropriate type 31 cores has a Z of 115/inch. That doesn't address the issue of whether the power / control connection needs protection.

Actually, I am not sure why you are doing this anyway, is it just in case or is there a demonstrated need?

Well, to be honest, I was primarily planning on using the choke for a base station application.... will have some sort of balanced dipole or loop fed by an SG-237 tuner. I wanted the choke for the coax feeding the tuner.

On the RV, I have a 23' whip on the back (ladder) which I had planned on feeding with another SG-237. (Currently it is fed with a home-brew base loading coil assy, on which I must manually change frequency taps.) In either case, I thought it might be beneficial to put a common mode choke on the RG8X feeding that antenna, too, since I do have RF causing various issues inside the coach while I am transmitting.

On your RV grounding question, yes, the antenna feedpoint and all related ground areas are very well bonded to the main vehicle chassis with rather large tinned braid, (2" wide).

Using more wire would make for a more efficient antenna
but you would need to short out some turns on the 160m
coil which causes a lowering of the coil Q. Ideally,
you would just use (wind) a lower inductance coil, one
with the exact amount of inductance needed. With a
large top hat and more vertical wire, the size of the
coil is considerably lessened. But shorting out the
unneeded turns on a coil is a time honored tradition.

Hi Ed,

You will have to choke the control lines just as much.

>I do have RF causing
>various issues inside the coach while I am transmitting.

That could be as easily through the air, or "ground currents" in the
chassis. All points of the chassis, doors, hood, etc. are not usually
bonded very well. Even the exhaust system can be "floating" to
provide a path from ground, right up into the engine compartment.

> On your RV grounding question, yes, the antenna feedpoint and all

Re my paragraph above, does this include doors? A lot may be taken
for granted and hinged points are sometimes insulated, allowing large
panels (capacitive plates) to couple RF inside what is considered to
be an otherwise tight box.

If the concept of duality is difficult to grasp when it comes to photons
just imagine how hard it will be to grasp that duality exist for all
particles and therefore all matter.

It has to do with the phasing of the photons and the
spacing of the elements. The phasing+spacing results
in constructive interference in the direction of the
director and destructive interference in the direction
of the reflector referenced to the driven element. The
length of the element affects (and effects) the phase
of the re-radiated signals from the parasitic elements.

Using EZNEC with two identical driven elements, one
can control the direction of maximum radiation simply
by adjusting the phasing of one of the driven elements
referenced to the other. Reversing the phasing reverses
the direction of maximum radiation.

Richard, getting clear details is like drawing teeth. I suspect the RV might be fibreglass, and so about as RF transparent as you might get. Further, something hints to me that the grounded ATU is on top of the ladder, so it isn't really grounded.

But in the absense of clear details of a single scenario, I can't help.

This:

"Einstein also said that behind every great theory there is a simple
physical picture that even lay people can understand. In fact, he said,
if a theory does not have a simple underlying picture, then the theory
is probably worthless. The important thing is the physical picture; math
is nothing but bookkeeping."

And this:

Amrit Sorli: Einstein stood on the point that the notion of "space"
designates "gravitational ether", which is a physical reality. "With
regards to the general theory of relativity, space cannot be imagined
without ether", says he in his "Ether and the Theory of Relativity".
According to Einstein, gravitational ether does not have the same
properties as ponderable matter, that is why it cannot be described by
notions such as "time" and "motion" .
...
Time is not a physical reality, the past and the future exist only in
human reasoning. Changes take place "here and now" in the gravitational
ether.

Cecil:

The "approximations" which EZNEC accomplishes, may, or may not be real--indeed, much of what these "antenna tools" have told me appears to work in reality ... I CANNOT and do NOT say these tools are without value.

However, when you have an "un-ponder-able unknown", such as the ether, and you see NO mention of it in mathematical equations, no allowances made for it, no affects/effects noted for it--indeed, when you see a public ignorant of it--don't you grow a bit suspicious? I mean, and according to Einstein, every bit of matter we can possibly view was torn asunder from it! It is real, we only exist in an altered and unnatural state--along with our antennas.

Why has ether become synonymous with "kook?" It should not be; why does it seem to have been missing from everyones physics books but mine? My books just stated it was as it appears to be--unknown, but a real thing--I took it to be a thing future minds would "discover"; that its' promise was a better understanding of the world, in the future.

Now, we can come up with a lot of explanations about a lot of things--might it not help to give this KNOWN/REAL thing some thought; ask some questions on its' possible interactions with our antennas?

If my wonder-ings about this ether cause me to be a marked man and easily dismissed--so be it. And, I would prefer to read and experiment in this direction than jump to the conclusion our antennas are emitting photons, others may feel free to disagree with me and suffer no evil intentions from me.

Whatever is the reality of this matter, let's pray it quickly becomes known; either way I will be just as thrilled. New discoveries, which we can get our minds wrapped around, speak of new and interesting phenomenon we can manipulate to our benefit.

And, debate is interesting ...

It is generally excepted that ether is space-time.
There are a couple concepts you must understand.
Space is not nothing.
When the universe was created it was not just the result of material being propagated through space, it was the creation of space itself.

This was not a new concept for Einstien, it was an idea he had difficulty and uncertainty about expressing.
Even Einstien had to deal with peer pressure.
